My C510A manual has been corrected to reference to auto repeat
capability above 147 mHz. Mine is about 2 months old.

There is truth in everthing I have read in this thread so far. For me, Engineering inherently is applications oriented work. However, theory and research is good too. I think most successful engineers (I don't mean just PE's, which is a title not a description) learn to blend theory with applications experience. The more one has of both, the better engineering one can do (in general).

Some schools do better in one area than others. Students and employers learn quickly which are which. Research is important for the profession, for stimulation of new ideas and for our Universities. However, not all researchers make good instructors, especially, of undergraduate students. Indeed, in my opinion, too much emphasis has been put on college instructors/departments having to have PhD's vs experience and good teaching skills in the last 20 years, or so. I would like to see a swing the other way soon. The fact that we have more technology than we know how to use well today may be a good argument for turning towards more "real world" and teaching orientated instruction/instructors at university level institutions.

I own both the 440 and the 690.Both of them will do packet just fine.
I'm kind of partial to the 440 as far as receive sensitivity and being
able to pull stuff out of the noise.As far as transmit,they both do a
respectable job but I received a lot more compliments on the 440 audio
quality.

4789. Kenwood TH-79A gets HOT

Sorry! As it has been discussed on several occasions, there are no out
of band mods for the HTX-202. It is stricly an amateur tranceiver. A
good one at that IMHO. The only way I have heard you can get it to
recieve out of band is to duct tape it to a scanner :-).

Source record: 166955

Hi Frans,

I contacted Kenwood to get more information about the protocol that is
being used to exchange data (frequencies) between the PC and the TM-V7.
However Kenwood replied that the protocol is proprietary (EZ-Clone however
got it ?!?), and that they've contacts with the makers of EZ-Clone to
distribute it themselves.

In the mean while, any information is welcome about cable-pin-layout and
protocol information (even from other Kenwood transceivers, maybe it's the
still the same) so I could eventually write the software myself.

I beleive the 47A uses a 4.7 ohm resistor also. It works like a fuse
and it is a 1/4 watt size.

As for freqs. Over the U.S. it's 145.985 simplex for both voice and packet.
In Europe it's duplex on 145.200 UP, 145.800 down. Rumor has it they will drop
2 meters by the end of September and go strickly 70cm. I hope this is wrong!
As for trajectory you need to get a satellite tracking program like STSORBIT
PLUS. Try http://www.dransom.com

4802. FT-8000R Memory Mod, if any?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-05 00:00:00 UTC
From: David Ho <davidho@one.net>
Message-ID: <Pine.LNX.3.95.970905113859.21797A-100000@shell.one.net>
Source record: 166810

I have heard that the FT-8100R is supposedly identical to its sister FT-8000R, except for the detachable front panel, the number of memory channels, and the 9600 packet fix.

Just wondering if there is anyway to increase the memory channels in the FT-8000R, like swapping an eprom or something like that from Yaesu. Did anyone contact Yaesu about that or am I just making myself an idiot?

Thanks in advance for your input.

Best 73!

Sorry Richard, tough times mean making tough decisions.
It sounds like others wanted to cater to him rather
than he catering to others by keeping his end of the
bargain in the company. And that he got sympathy
from everyone means he did that rather well, rather
than being the engineer he claimed to be. Decide
whether you want him to be a welfare case of your
company or an engineering source for your company.
There's been too much downsizing going on with
companies to afford catering to someone who can't
carry their own weight. They only block some
other person that lived under war-time conditions
barely escaping with their live with sick family
members who can equal or even excel other engineers
in their group. I've seen it happen both sides.

I'm sorry to sound so hard, but if you want
engineering get engineers. If you want welfare
cases, go to the welfare department.

FOR SALE
CB equipment:
Browning Golden Eagle Mark III three pieces sold as a set $600.00 + shipping. (Offers considered) Overall appearance is very good to excellent & it was working when removed from service. There are no books or microphone with it. Each piece has a metal case w/ faux wood grain covering. Front panel & markings on all three units are excellent. The only observed problems with these units are as follows: Receiver has a few light rust spots on the transformers & chs. Transmitter has few light rust spots on the transformer. SSB15 Transmitter has 1 spot of chs rust & there is a good deal of flaking of the faux wood grain case covering on top.

HAM gear.
TMC FFR3 military receiver w/ 8-16mcs tuning drawer. Overall appearance very good. Rack mount. Top cover & power cord missing. Not tested. $150.00 +shipping (Offers considered)

National receiver NC300. Overall appearance very good, some paint scratches. Not working, hum only. $200.00 + shipping. (Offers considered)

TUBES-All military boxed.
GL 8020 GE $40.00 +. 3 available
6U7G RCA $2.00 +. 15 available
12J5GT SYL VT135 $2.50 ea + 11 available.
717A Western Electric $20.00 ea. 4 available.
+shipping

Prices are fob Baltimore , Md. Offers will be considered on any of the above items.

<snip>
I agree.
This reminds me of the story that a friend tells about his
collection of cameras. He has a full-featured 35 mm SLR with
all the lenses and he has a compact point-and-shoot camera.
Which camera takes better pictures? The compact point-and-shoot
because it is the one he actually has with him when the
photo opportunity arises. The heavier, bigger one is sitting
at home.

So it is with the VX-1R.

Well, just what do you mean by "full transmit"? I have a TS-570 and it transmits just fine---whole buncha modes too.

Clarify your question...

And the really neat thing about it is you can use it anywhere! On the way to work in the morning, in the office with a set of headphones, killing time while waiting for someone/something. It's a great way to learn the code and increase your speed.
The only thing I question is the $80 price tag. Sure MFJ doesn't have a big market for this but it's a little steep.
Once you pass your 13 wpm test let other's use it. Loan it out to the local club so the Tech+ and Novices can move up.

Doug,

if you do not need Crossband Repeat then it is not a bad rig. I just bought one last week at HRO. I had to return the first one since it only put out 22 Wats instead of th epromised 45W. Make sure you check the unit before you buy. I payed $399 for it and I think it is an OK deal.

That advice makes no sense to me. I know that silicon devices can
operate indefinitely at far higher temperatures than water-filled
carbon-based creatures like myself. The rear of the external case is
not a plastic shell but it is the metal heat sink for the output
devices that is expected to attain temperatures usually encountered
in structures hidden from fingers around the rears of mobile rigs.

I agree, the VX-1R is an excellent little rig. Just think only a few years ago we had rigs with crystals and was happy with 1 to 6 channels. I think every ham should have a VX-1R if only for emergencies. What this small package can do is truly outstanding!

I want to wire a Radio Shack Speaker Mic to my Kenwood TH-79A. The mic terminates with a red wire, a yellow wire, and a shield wire. I have some plugs (3/32" and 1/8") to connect to the radio, but I have no idea how those wires connect to the plugs. Can someone explain how to do this? Please help, this has to work!! Thank You.

4825. Re: RFI in Chevy Truck on 147.39

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-05 00:00:00 UTC
From: Gary Sanders <gsanders@gte.net>
Message-ID: <5uq49jdsb1@gte1.gte.net>
Source record: 166833

After going to Dayton one year, and talking to their reps from this group, I did the following:

1. Go to the dealer. His response was "If it doesn't interfere with the AM or FM radio, it's not our problem."

2. Contacted the same group you mentioned below. Their response was "Have the dealer contact us and we'll be glad to work with him. But they have to contact us - we can't contact them. However, since your dealer is an independent business man, if he elects not to have us help, we can't do anything."

The local dealer refused to contact them, because of reason (1). It was getting to be an endless circle, all dependent on the dealer getting off his duff and doing something. The electronic compatibility people said this was not an unusual dealer response, unfortunately.

This was several years ago, and maybe the situation in GM has changed by now, but my gut instinct tells me it's still the same.

(By the way, based on my overall experience with the Chevy truck, I now drive a Dodge - and I love it!)

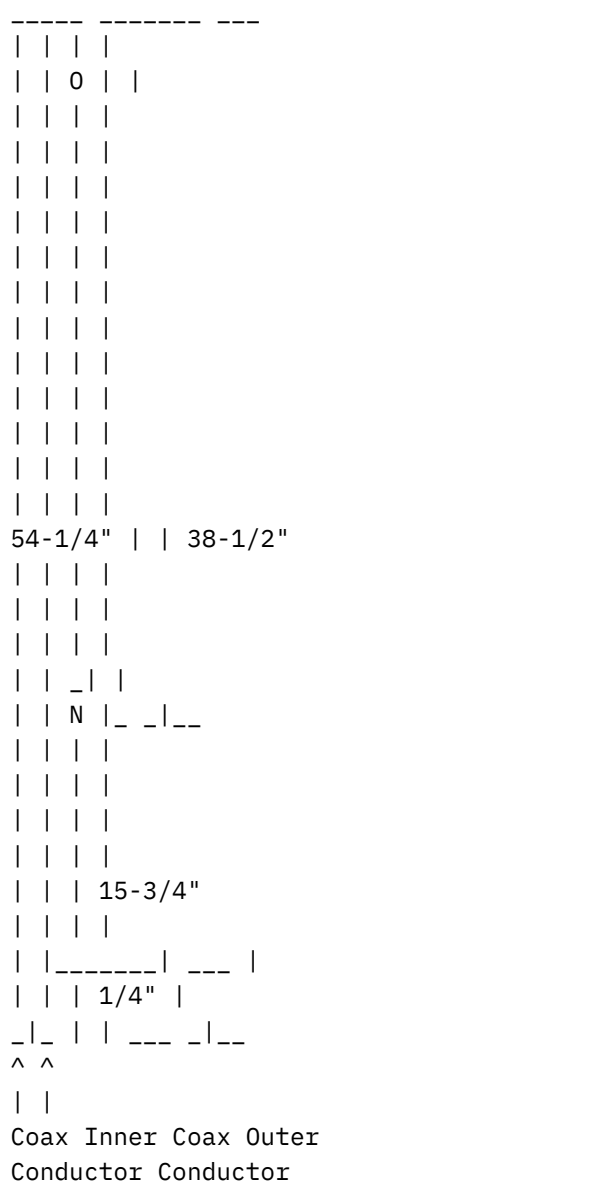
4827. Re: dual band antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-05 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <970905161805188 54@atdbbs.com>
Source record: 166835

Here's a dual-band antenna that might cost two or three bucks...

=== 2m/70cm Dual Band J-Pole made from 300 ohm twin lead ===



SWR is 2:1 across the 2m band and from 435mhz to
450mhz on the 70cm band.

1. Use good quality TV twin lead.
2. Strip insulation at the solder point for coax feedline.
3. Cut out and remove the 1/2" long notch N.

4. Feed with a length of 50 ohm coax and terminate with the appropriate connector. Tape coax at feedpoint to the twin lead, or use heat shrink, and make sure the joints are insulated from each other.
5. Antenna may be sleeved inside 1/2" PVC for outside mounting or hung on a loop of string run thru hole O.

4828. Syntor X Receive sensitivity improvement 440 - 450

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-05 00:00:00 UTC
From: Gary Sanders <nospam/gsanders@gte.net>
Message-ID: <5uq64jktb1@gte2.gte.net>
Source record: 166836
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Has anybody found a decent way to improve the receive sensitivity of the UHF Syntor X in the 440 - 450 range?

I've tried retuning the front end and injection slugs (you know the ones, they're marked DO NOT ADJUST!), and I've installed the factory preamp. The tuning didn't help at all, and it took me forever to get it to some semblance of working at all again! The preamp helped a lot, but the sensitivity is still poor below about 448 mhz.

As it stands right now, the sensitivity is about 100 microvolts or so at 442, and getting better the higher it goes in frequency, until it's about a quarter microvolt at 449 and above. It stays that way all the way up to 470. It's basically unusable through most of the 440 band.

By the way, I'd like to not necessarily kill the sensitivity at the high end, if possible, just extend the low end. If that's not possible, I'd like to shift the passband down to 442 to 263 mhz.

Anyone have any ideas?

73,
Gary

You mean other than Radio Shack? (Sorry, just kidding.) :^)
Don't know of any general purpose electronix stores around Rockville.
The RF Connection in Gaithersburg sells antenna supplies & connectors.
Arlington Electonic Wholesalers on Lee Hwy. in Arl. is the closest
regular parts shop I've seen.

You could also try the Gaithersburg hamfest this Sunday at the
fairgrounds.

>and I am at a loss how to rectify this. There is no ICOM service center
>in India either. Please help...

Ok, I'll give this a try. The 2m receiving filter is a totally passive LC
filter. I doubt a component in it has failed. However, it is diode switched
in and out of the circuit. Outside of 2m, another filter is used for wideband
reception. There are two pairs of diodes which switch these two filters
depending on where the radio is tuned.

It is possible that the source of voltage for these diodes is failing, so that
it is not enabling the 2m filter when tuning 2m. There are a couple of
driver transistors which are in turn driven by an interface IC. One of these
could be leaky. You'll need to take some voltage measurements as you
tune in and out of the 2m band to track this down.

However, since it worked for a few minutes, the problem could be an
intermittant solder joint. The simplest repair attempt would be to examine
and touch up solder joints in this area before you start ripping out components.
Be careful, the filter uses surface mount components, as do the switching
circuits. (The circuits are located on the PA board.)

Note that there is *another* filter, the output filter, which is in line with the 2m receive filter. This is a simple lowpass filter, however, and is present whether you are tuning inside or outside of 2m, so it is unlikely to be the problem area. There is also a PIN diode TR switch, but it is also in line both inside and outside 2m, so it is probably fine too.

To seriously troubleshoot this radio, you really *need* the service manual. Without the schematics and board layouts, it is very easy to get lost on the high density boards. I suggest you order a service manual immediately. It will come in handy if you later want to modify the radio as well as being immediately useful to you in troubleshooting this problem.

Tim,

You might want to contact GM about this. Even though the 1800 number tells you to contact your Chevy dealer and your Chevy dealer says huh? you might try this number/address. It should give you better results even though they try to ignore the problem and hope you, and not the noise goes away.

Electromagnetic Compatibility
General Motors Proving Ground
Milford, MI 48380-3726

248.685.6150
248.685.5154 fx

Contact at last check was Don Hibbard

They have a Fuel Pump module designed to help the problem but it is a bitch getting them to admit the problem is theirs. Other suggestions have included

Cruise Control (as just noted)
ABS
Air Bag computer
Main Computer Module
EFI
Fuel Pump

Good luck. I have been on them since my 96 Blazer refuses to be quiet.

Hello!

I am looking for the following filters for the Drake R4C:

International (Fox Tango) Filters:

1. 250 hz Stock No. 2601.2
2. GUF-1 for 1st IF, Stock No. 2612.1

I am also looking for a Drake NB-4 noise blanker.

Please, e-mail direct to eb5agv@ctv.es

Thanks!

4854. Looking for HF transceiver in Canada only.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-05 00:00:00 UTC
From: morinm@csgoeland.qc.ca
Message-ID: <873473977.23153@dejanews.com>

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Hi there I am looking for an all solid state HF transceiver with general coverage in the receiver section. I don't care if it's mobile or base station. The rig has to be clean and in perfect working order. Has to come with instruction manual and microphone.

I am not interested in rigs with tubes in the final nor do I want to buy antiques. Yaesu FT-101 series sellers need not apply. I don't want to buy in the U.S. because the customs will eat my shirt. I just had a taste of that in a swap I made with a ham in California. And we are supposed to have a free trade agreement.

I know I could buy locally but the market is very scarce around here. We have only one ham shop and they only sell new equipment and they don't seem to sell a lot of that either. I also want to see the range of equipment that will be offered.

The radio has to be under $1000. Canadian, which means I don't want to sell my wife and kid to buy a Yaesu 1000. Please make your offer by email stating what you have to sell, its condition and the price you want including shipping and insurance to Montreal.

73 de VE2CJW
Michel Morin
Candiac, QC
Canada.

Anyone out here heard any pro's or con's for the Cushcraft X9/X7
antenna's
that are out. They seem to be pretty good in the spec department, and
they look good... but do they perform..?????

Thanks

In the upscale areas, here, where the public schools are almost like "good" private ones, they teach to the tests (SAT and State), a lot, of rote memorization, of past test material. The kids are sent, to SAT schools, by their parents. In both they are warned not to learn or understand, as knowledge and understanding will confuse the student, and result in lower test scores. Only loosers either read or study, to learn. The trick is to just memorize past SATs. Careersuccess, for school administrations, depend, on high SAT scores. Also high grades, demanded, by "upscale" success oriented parents. The kids are are told that their entire lives depend on extremely high SAT scores. If they don't ace the SATs, in their Junior year, their life is as good as finished. If they do ace the SATs they will get in a prestige school, that wouldn't dare not give them high enough grades to get into the graduate school or professional school, of their choice. They will also get, to network, with the "right" people. Get high SATs and high marks (almost assured by obscene grade inflation), and they can set back and ride the easy road, to $ucce$$. The theory is that you really don't have to know anything, to succeed in a profession, you just need degrees, from the "right" schools and networking, with the "right" people. School projects are judged, and marked, by the dollar amount, of materials used, not the inspiration, originality, thought, knowledge and understanding going into them. Through the year things are done, to put the less economically advantaged students, at a disadvantage. This includes requiring the excessive amount, of school supplies and requiring expensive name brands. High school courses are "enriched" with "college level" work, but the standards are very low, and grade inflation insane. Kids are told Bs are low grades, like D-s, in my day; sadly, with the grade inflation, they probably are. Kids here are told they must read, at least 10 books, each Summer, but the only real requirement, is that they get a parent, to sign that they read the books, they will not be tested or questioned, on what they read. Of course, few read anything, and the parents willingly sign lies. The schools knowingly accept the lies, and brag that their students read 10 or more books a Summer. The kids are being taught, to cheat. For school reports, in subjects other than language, they are told spelling, grammar, complete sentances, logical thoughts and structure don't count. Materials taken, from computer CDs are strung together, with incomprehensible non-sentances, in no particular logical order. That is a description, of an "A" paper.

The above describes the upscale suburbs, where most parents have college degrees, good jobs, incomes well within the top 10% of America, and high expectations; and where education is supposedly respected. We are continually told about how bad the schools, attended by poor Afro-Americans and Hispanics, are, in the inner cities. The upscale suburban schools, attended by economically well off Whites and East-Asians are bad in different way. Can we wonder why colleges have problems? My niece tells me, I better get used to this, as it is the reality, of today; these kids will be the doctors, lawyers, etc. of tomorrow. Scarry isn't it.

Word Perfect (or as I call it "Word Imperfect") also insists on
capitalizing words that should not be capitalized. I haven't had the
problem, of not getting 2 soaces, after a full stop (except when I have
both right & left justification and it has to stretch too much, to make
it fit; it stretches the single spaces oout tothe same as double. I
wonder what rule, of English, Wordperfect uses, when it insists words,
after abreviations must be capitalized.

i wondering where i left my prototype! =]

seriously tho, gateway electronics in st. louis [closet walk-in store]
advised me NOT to trade up my mk1 706 to a mk2 they had in stock
because they would be getting a "mid-size" radio with the same bands
at 100w about 6 weeks ago. this is why they get my business

> Mike Copeland
> mcopeland@pobox.com

The IC-211, being vintage late 70's, never had a "factory" subaudible tone deck ... you will have to go with some sort of aftermarket unit, like the Communications Specialists SS-32P (encode/transmit only) or TS-32 (encode/transmit and decode/receive) - dip-switch programmed, built for internal installation, or the TE-32 (outboard unit, rotary-switch programmed, encode/transmit only) ... see page 88, center column of the current AES catalog for details. Either way, you will not be able to "program" the tone from the remote or from the radio ... programming will be "external", via either dip switches or rotary switch.

Best of luck, and very 73!

"Squeak" Porray, AD7K
Manager, AES/Las Vegas

I recently picked up a RF Direction Finding Radio model : AQUA GUIDE
705, radio direction finder 5 band
It is made in Japan, and covers FM, BCB,CB, VHF, LF.
It has a rotatable ferrite loop on top that plugs in like a palomar
loop for BCB and LF. It has a whip for CB/FM/VHF. (also an external
SO-239 connector) It also has a second whip connected to a button on
top labeled "sense". The controls are Vol/DF level, Band, adjustablr
ANL, Tuning, light, batt check, AFC, Radio/DF switch. It has a slide
rule dial and a s-meter. it is about 12"x12"x 4" high. runs off 8 C
cells or ext 12vdc. the case is blue. I have never seen or heard of
this radio before. It appears to has tuned RF stages on all bands, and
very good selectivity. Any info??????
Thanks in advance
Tim

I have, but only to a field strength about 100 feet away from the installation. I tried a couple of different center loads, and they both registered about 15-20% more strength than my SGC. If I were only planning mobile operation, I would go with something like a screwdriver antenna - but the SGC is UNBEATABLE for oddball random antennas from my RV, its convenient, requires NO operator interaction, is weatherproof, and once a decent length of wire is attached, it performs GREAT!

4872. Yaesu VX-1R -- Buyers BEWARE -- Bug Infested!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-06 00:00:00 UTC
From: jcross@orednet.org
Message-ID: <5uqmae$l41@ednet2.orednet.org>
Source record: 166762

Buyers beware Yaesu's VX-1R is BUG infested!!! Seems the Firmware Engineers and Beta Tester have not been keep in check again. Here is a list of malfunctions that I have encountered with a week of operations:

1. Once a memory channel is written with information from anyone band it cannot be overwritten with new data from a different band such as suggested on page 34 of the operations manual. The Beta testers should have hammered the engineers over this.

2. The tone decoder systems (CTCSS "PL") and (DCS "DPL") do not function the VHF TV band 170-222 MHz or UHF TV band 470-800 MHz. But the decoders work in the AIR band 107-137 MHz. This clearly demonstration of the Engineers and Beta testers lack of knowledge in types of communication used on these frequencies.

3. When you send the unit in for the Mars modification you will get it back the ARS (Automatic Repeater offset) killed. Regardless ARS ON/OFF settings. You will now have to manually enter each new repeater offset when needed. Another Firmware defect!

4. The Emergency Channel Operations function of the VX-1R is also bug infested. If you have the BEEP function in the OFF condition and activate the Emergency Channel button the unit will alarm, but will not deactivate as indicated in the operator manual as indicated on page 30. You will have to turn the units PWR switch OFF and re-power the unit to kill the noise. Good news, it will work correctly if the BEEP function is turned ON. Beta tester and Engineer did it again! If Firmware space was needed to make items 1, 2, and 3 work this would have been a good place to lower the bit count! SNIP HERE!!

5. The VX-1R speaker audio is a little on the short side for volume and quality, but what can you expect out of a midget HT.

6. The MH-34 Speaker/Microphone has poor TX audio quality and does sound worse than the units own microphone.

I made a call to the Yaesu folks and was given the "it isn't a BUG treatment" and "We don't plan to fix our problems" tunes. Of course this was after an hour of telephone wait time on my dime.

Who knows what other little quarks are in this little midget HT. I am half tempted to return it to the place of purchase for a refund. Guess this is another way to voice your opinion.

Seems to me that the Firmware Engineer and Beta Testers need to
review the sharpness of their Samurai Swords at Yaesu before the
release of their next production line units.

So buyers BEWARE this is what you get!!

Jody Cross -- N7ERT -- EX WA7CIP, WA6FPU, HS4AKF, VK8JC, and HL9IO
Systems Design Engineer.

There is, on a typewritten page. However, it has become a convention on the net to use only a single space. Saves a minute amount of bandwidth.

Stan, you've verified something I've suspected for some time. IIRC when I
built my GC-1000-H back in 1990, one of the tone detector pot adjustments
(can't recall whether it was the 100 Hz or 1 kHz detector) was *very*
twitchy, and I almost decided to swap the stock pot for a multi-turn
trimmer (assuming I could keep the kludge factor tolerable). Since then
I've had a residual concern that someday the detector would drift enough to
make decoding problematic - but somehow it seems like I've dodged that
bullet, as my clock has tended to go "Hi Spec" several times a day in the
last month or two. But then my luck may change (g).

When I was in the US Coast Guard, we used these devices to keep radio beacon keyers in time. One of the mods that really improved the reception was to install a 500hz ICOM filter in the IF. This almost removed the audio of the voice recordings, but raised the reliability of the clock signal several times. This may improve your reception as well.

4883. Re: Heath Most Accurate Clock

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-06 00:00:00 UTC
From: Stanley Perkins <stan@netcom.com>
Message-ID: <341154C1.4570@netcom.com>
Source record: 166773

One other thing I found out about the Heath GC-1000:

The 3.6 MHz crystal timebase is electronically steered by the microprocessor according to the data it accumulates from WWV. The idea is that during signal outages, the internal timebase will keep the clock from drifting a whole lot. So far, so good. BUT...

The voltage of the +5V bus (which is also the voltage presented to the steering circuitry) depends on the position of the display switch on the left side of the clock. If the display is on, it's one voltage, if the display is off, it's a different voltage, and the timebase shifts a significant amount.

After a bit of head-scratching, I found a quick and easy fix for this. The display switch still works, but the timebase is unaffected. Better yet, it takes ony a minute or two to perform. Even better, it doesn't involve any irreversible modifactions to the clock (for you purists out there!). It involves removing one of the display board ICs, bending one pin so it's sticks out at 90 degrees to the rest of them (so it no longer goes into the socket), and then replacing it. It's pin 16 of the IC mounted directly below the "Hi Spec" LED (U101, an MC14543). Of course, this needs to be done *only* if you turn the display on and off. Otherwise, the +5V supply never changes, and the oscillator ssets itself up accordingly.

Hope this helps!

Regards,
Stan

4884. Re: Mitrek Repeater Conversion Help ////////////////

Newsgroup: rec.radio.amateur.equipment

There are modifications for the Mitrek for repeater use. However, they're
not
recommended for repeater use because the transmitter and receiver sections
are all mixed togther. Micor or GE Master II is a better option.

4888. Yaesu FT-990 Help Please

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-06 00:00:00 UTC
From: Dale Wentz <dwentz@accessus.net>
Message-ID: <01bcbacf$07e55d40$a32404d0@dragon.mcs.accessus.net>
Source record: 166778

I have a FT-990 DC that did not have a 500Hz CW filter in it. I ordered one from AES, and the box says XF-106C, which is the part that I ordered. But the Filter has XF-10.9M-501-01 On it. The XF-10.9M-202-01 is the 2.0 SSB filter. The filter seems to work, but not as well as I think it should. Can anybody confirm that I have the correct or incorrect filter.

Thanks for you help

FS:

RT1510 HF SSB transceiver , made by Cubic Defense Systems

Modes: USB,LSB,AME,FSKW, FSKN (500 Hz), CW (500 Hz)
Frequency entry via keypad or remote control
100 non-volatile memories which store frequency and mode
Phone-patch option is installed
Freq range 1.6 MHz to 30 MHz in 10 Hz resolution, 120 W RF power
Copy of service manual available

Yes, proper punctuations and spellings are technically useful. But if you can't convey the true intent of your message, then all this writing formalities are useless. So let your mind freely speak in words and let others, who enjoy the use of proper language structures, make the corrections. Of course, it doesn't hurt to learn from these perfecto writers. In fact, I enjoy them myself because my alma matter did not prepare me to write the art of good English grammar.

4894. Opinions wanted on Ten Tec equipment.

Message-ID: <873567497.24755@dejanews.com>
Source record: 166784

Someone suggested I buy a Ten Tec Delta II transceiver
to replace a rig I just sold. If you have any
experience, good or bad with that unit, would you
please email me your opinion. It would be highly
appreciated. It seems that QST didn't like that
model when they reviewed it a few years back.
What I want is a HF transceiver with general coverage
receiver and that is all solid state. It has to sell
for less than $800. U.S. used. If you have recommendations,
please feel free to email me about them. Thank you.

When computers gained popularity and proportional type spacing became
the norm, the use of two spaces following periods and colons ended.

They do still use voice but most of the time they are in packet mode. The
new freq. over the U.S. is 145.985 simplex. Over Europe it's 145.200 up
145.800 down. They are testing a 70cm freq at the moment, 437.650 simplex and
will be back on 2 meters shortly. Your area is just fine. Keep listening!!!

If that's the basis for you said, then why bring
it up for any sort of discussion? No one here
is in any one else's shoes all the time. So by
this logic, we all might as well go home.

I've worked in companies that opened their doors to
all sorts of people with many varying backgrounds.
Those that proved in a short time to misrepresent
their abilities were let go. A few of the engineers
could not substantiate their background simply because
there wasn't enough room on the sampan when they escaped
a country where genocide was killing millions of people.
Those engineers went on to do very well. In fact, some
excelled the home growns. I happened to work with one
of the best engineers I've known who got off the boat
in New York city with nothing and spent his first
night in freedom sleeping on the ground in Central Park.
Aside from the engineering aspect, these experiences
should be used as lessons for most of us.

But, the tone in your previous post sounded as if the
person to which you were referring was less than what
you have stated in the above post. If he can do what
he claims to do, that's enough for me. Even more so
that you stand behind him.

So what is your point Gary. Did this fella use your money to buy this
nice radio. If so then I guess you can tell him what he can or cannot do
with it. My opinion is that if a person wants to spend that kind of
money on a radio to use on 11 meters then so be it.
Just my opinion!!!!!!

One of the most memorable statements from my undergraduate days,
was one of the professors telling us that we would probably never
use 90% of what we learned in school. Unfortunately they couldn't
tell us what 10% we would need.

> Now, we have the American culture here: with Word 7 you don't need to
> spell correctly. You type "C" and it expands it to "CV" and when you
> press the space bar after that, it pops up a Wizard which generates

Well, that is a whole other religious war... But, one of my pet
peeves is word processors that think they know more than me,
and change things without asking.

> I currently work on a big project involving an American company, and
> out of the 10 or so people I regularly liase with, only 1 or 2 can
> write anything resembling passable English. All are graduates. Some of
> the e-mails and faxes I get are gobbledygook.

From the American side of the pond:
I have to agree. Many American's writing is terrible. My
Japanese girlfriend has been studying English for about 1.5
years and while her written engligh is poor, it is as good
as some Americans' I have have read. At least she has a
reasonable excuse.

The Engineering Schools argue (and rightly so) that they
shouldn't have to teach incoming students English. On the
high school side, there seems to be little motivation to
do a good job of teaching English. I have a friend who was
a high school teacher who wanted to push the students to think
and learn. The students didn't like this and would complain to
their yuppie parents, who would complain because their kids
were getting poor grades and wouldn't be able to get into a good
college. Now one would think that if the Universities actually
admitted on the basis of compentence rather than grades, there
would be motivation to teach and learn at the high school level.
But wait! If the University instituted any real meaningful

standards, it would reduce the number of incoming students and subsequently, cash flow. Surprise, surprise. Maybe it is an economic issue!

Seems we have a couple of problems at hand. On one side, the education system has to decide who their customer is, the people who want an education or the people who want a job ticket. Unfortunately there seems to be more people who want the cushy job than those who want the education.

On the other hand (or maybe it's the same hand?) we seem to have those who, in a well intentioned effort to make education acessable to all, have socially "engineered" <cough, cough> the system to where the standardsa are low enough that nearly anyone can make it with minimal effort.

> much among American graduate programmers today. I suppose they just
> play baseball.

Nah! Baseball's passe. "MTV" and "Beavis and Butthead" are the mind candy of choice nowdays.

> Flame away.

I was going to, but I can't figure out the directions for my flamethrower. ;-)

Please pass this to the reflectors you subscribe:

I have a builder friend that has contributed a lot to our
repeater
projects. He's a "real ham" in that as an Extra, he likes to
build his
own CW Amplifiers. He has noted that he needs a pair of 450TH's
for his
CW amplifier project. We came up with ONE new one.

If anyone has more (including a spare or two), I would be
willing to pay
cash money to endorse the building part of the hobby for Ken.
We're
loosing the "real hams" that build equipment, and I want to
acknowledge
his help by buying what he can't afford.

Please contact me at wa6bzs@amsat.org if you have any 450TH's
that I can
buy with CA$H.

Thanks

4904. HELP! HELP! My FT-51R

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-06 00:00:00 UTC
From: trex2000@txdirect.net
Message-ID: <3411cfe8.1555408@news.txdirect.net>
Source record: 166794

I recently attempted the "Mother of Mods" on my FT-51R. The mod appeared to work, but my ADMS-1 software would not. The software took a template fine, but gave me the error message (on HT screen) when I attempted to reload. Not being very satisfied with the reception with the hardware mod, I "undid" the mod. I then tried again to reload my freqs to the HT. Again I got an error message. I then manually entered my freqs, took a template via software, and found that the software had uploaded my freqs O.K., but did not include the tones I had entered. Transmission on the HT enabled me to discover that for some reason I had changed the radio into "Euro-Mode". Then, after doing the CPU reset (vfo+mr+2), I really found out I was in the "Euro-Mode". How do I get my HT out of "Euro" and into "USA"? Could my using the ADMS-1 (No version given, but copywrite ©95, SN 07950321) have caused these problems? Could my use of WIN95 have changed my software output or compatibility? (I did use both newer and older versions of CTL3DV2.DLL). My jumpers are set at original, not MARS/CAP, that is, JP 1,4, and 7 are closed. Can someone please help? Thanks in advance, Scott (KB5YOK)

> Yes, proper punctuations and spellings are technically useful.

They're not just "technically" useful. They are absolutely necessary
in many situations in order to impart the correct message. When we
deal with many engineering communications, for example, correct spelling
and punctuation can mean the difference between a project that works,
and a project that ends up in litigation for failing to meet the
client's requirements.

I believe the radio will put out either 50 watts or 100 watts on 2 mtrs
The brochure says 50 watts with a * and 100 watts. maybe modifiable.
Also, according to several people who attended the Japan Radio Fair,
the IC-746 is TRIPLE CONVERSION and has TWIN PASSBAND TUNING.

I am waiting for it in the USA market. Oh, Icom USA says they are not sure if the radio will be just for Japan or worldwide. First, they say this as to move the older model off the Dealer shelves. Second, they denied the Existence of the ICOM 706 Mark II till wit was on the Japanese Web page. Don't get suckered into an older model folks.
The Icom 706 MK II was supposed to have DSP (look at the Display at an angle.. you can see "DSP, NR "). Icom says maybe another model was going to share the same Display. RIGHT.. If you believe that I want to sell you the Brooklin Bridge. Icom couldn't get the DSP to work on 2 mtrs in time and decide to release the radio minus DSP.
If Icom USA doesn't want to sell the radio in the USA then I have 4 Japanese Radio Dealers with Web sites that would be happy to sell the radio to you.

> > I have a Kenwood TH-79A and it gets hot

In addition to the other useful responses here, may I add this:

If the HT gets hot, it could also indicate a poor antenna
match. Borrow or buy a cheap SWR meter and verify that
you are getting a 1.5:1 or better match. If it's higher,
you may be dissipating your power inside the radio, instead
of radiating it to the world.

I have several items for sale for the widow of a friend. Please contact me if you are interested in any item or the entire package. I prefer to sell as a package. All items have manuals but no original boxes. All items are clean and in good condition. I will refund your money on anything you buy and are not happy with. The shipping will be yours. All prices are plus shipping. If you think the price is too high, make me and offer, but don't wait too long or bid too low. This is all good gear and someone will pick up a bargain. I am going to do something this next week or so.

Kenwood TS-430S HF rig $500
MJF 989B 3 KW tuner $175
Trip Lite 40 Amp Power Supply $100
Kenwood 241A 2 meter rig $190

There are also filters, straight key, headset, speakers, short coax cables with ends, and some junk box materials. I want to sell all of it.

Subject: "The Clip" universal belt clips

In the new Radio Shack catalog on page 41, the belt clip is advertised
at a reduced price of $3.49. You are asking $2.50 + $1.00 = $3.50!
Doesn't sound like a deal to me.

Doug,

if you do not need Crossband Repeat then it is not a bad rig. I just bought
one last week at HRO. I had to return the first one since it only put out
22 Wats instead of th epromised 45W. Make sure you check the unit before
you buy. I payed $399 for it and I think it is an OK deal.

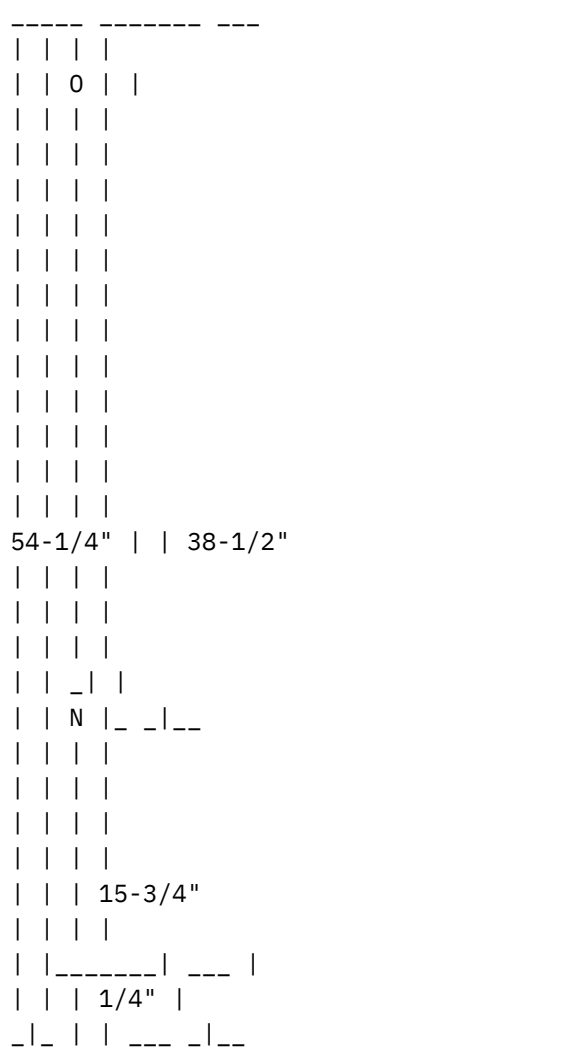
Here's a dual-band antenna that might cost two or three bucks...

=== 2m/70cm Dual Band J-Pole made from 300 ohm twin lead ===



^ ^
| |
Coax Inner Coax Outer
Conductor Conductor

SWR is 2:1 across the 2m band and from 435mhz to
450mhz on the 70cm band.

1. Use good quality TV twin lead.
2. Strip insulation at the solder point for coax feedline.
3. Cut out and remove the 1/2" long notch N.
4. Feed with a length of 50 ohm coax and terminate with the
appropriate connector. Tape coax at feedpoint to the twin lead,
or use heat shrink, and make sure the joints are insulated from
each other.
5. Antenna may be sleeved inside 1/2" PVC for outside mounting or
hung on a loop of string run thru hole O.

Subject: FT-8000R Memory Mod, if any?

I have heard that the FT-8100R is supposedly identical to its sister FT-8000R, except for the detachable front panel, the number of memory channels, and the 9600 packet fix.

Just wondering if there is anyway to increase the memory channels in the FT-8000R, like swapping an eprom or something like that from Yaesu. Did anyone contact Yaesu about that or am I just making myself an idiot?

Thanks in advance for your input.

Best 73!

I agree, the VX-1R is an excellent little rig. Just think only a few years ago we had rigs with crystals and was happy with 1 to 6 channels. I think every ham should have a VX-1R if only for emergencies. What this small package can do is truly outstanding!

That advice makes no sense to me. I know that silicon devices can operate indefinitely at far higher temperatures than water-filled carbon-based creatures like myself. The rear of the external case is not a plastic shell but it is the metal heat sink for the output devices that is expected to attain temperatures usually encountered in structures hidden from fingers around the rears of mobile rigs.

And the really neat thing about it is you can use it anywhere! On the
way to work in the morning, in the office with a set of headphones,
killing time while waiting for someone/something. It's a great way to
learn the code and increase your speed.
The only thing I question is the $80 price tag. Sure MFJ doesn't have a
big market for this but it's a little steep.
Once you pass your 13 wpm test let other's use it. Loan it out to the
local club so the Tech+ and Novices can move up.

Subject: Standard C510A - Auto repeater offset

My C510A manual has been corrected to reference to auto repeat
capability above 147 mHz. Mine is about 2 months old.

Mike - K9JRI

Bloggs@in.the.uk.com wrote:

<<One problem I see is that (in the attempt to learn a bit of
everything) one learns a great deal which is barely relevant. I recall
doing an enormous amount of very complex mathematics, which I now know is
not applicable to perhaps 99% of electronics work.>>

So true. In some ways, education tends to be inefficient. That is
one reason for specialization. But even for the fields in which you do
not specialize, you know that particular principles and methods exist, and
you know where to go to review them or learn more about them or get help
when and if you suddenly need them. That makes you more versatile than
you would be otherwise. Be thankful for all that learning. Don't write
it off yet!

<<But I spent perhaps 50% of the time learning esoteric things which
neither myself nor anybody I have ever met since have ever found useful.>>

I date myself here: I learned much of that before microprocessors
existed, and thus when those applications were little more than a dream.
But it was a very enjoyable and intriguing dream! Over the years, much of
it has come true. As an electrical engineer, some times I feel like a
little kid in a toy store!! Example: good convolutional encoder and
Viterbi decoder on a card or chip.

<<...we must teach our students the BASICS OF LIFE...>>

That is not all bad. After graduation, probably it is easier to learn
the basics of microprocessor programming, than to learn "heavy
mathematics". Beyond the basics, work closely with a software specialist.
That approach has worked well for me.

<<Someone too lazy to spell correctly (notice I am starting with the
charitable assumption that the person CAN in fact spell) is going to be
FAR too lazy to do a good job of ANYTHING.>>

If he is very brilliant, then his organization assigns somebody to
clean up his English; otherwise, eventually he may be out of a job because
nobody else can understand him.

<<It used to be that (in the UK) one needed an O-Level in English
Language to get into a university.>>

Is that not still true?

Many years ago, I was working on a program in which our customer was furnishing us with information that was almost unintelligible. I made some unkind remark about it to my boss. He reminded me that part of our reason for existence, was to bring order to their chaos. But I admit that it is much more fun to work with people who communicate well.

<<Flame away.>>

Not at all! Good discussion.

What's the chances that Mir is still hamming on voice? I've put several
freq's in my scanner and radios listening for them,(while tracking) and
have heard nothing. No packet racket, either. Have the duplex freq's but
was using 145.550 for simplex, 145.985 is a new one on me. Do the
simplex freq.s change? Maybe I'm just in a bad area. Opinions?
thanks,
Randy, KC8CPK

I tend to believe to old tale that it comes from a british accented
(cockney?) hamateur radio operator.

While everyone is talking about the RM-2 ad IC-211:

Is there any way to make the radio stop scanning when it hits an active frequency when using the RM-2 to scan memories? Or did I miss something in the RM-2 manuals?

Thanks for any help.

I have been with AT&T Worldnet for three years as have my son and
daughter. Excellent service. Tech assistance has always been right on;
no problem they could not fix. And, my business requires me to travel
in the most isolated areas of southern WV, eastern KY, SW VA, and NE
TN. I can access a Worldnet number from anywhere at low cost and with
superb service.

4944. FS: HP CALCULATORS

For Sale:
HP-12 Business and financial calculator.
HP-15 Scientific calculator.
HP-10 Business calculator.

The HP-12 and HP-15 are RPN calculators, the HP-10 is algebraic (it may have a function to make it use RPN).

I have two of the three manuals; the missing manual is for either the 12 or 15.

$50 for all three. They all work.

> > > > >
> > > > > Tim KF8XW
I had a similar problem with my 92 GMC pickup. Mine was evident at
146.53 Mhz,
which made using .52 simplex impossible. By pulling fuses, I was able
to determine
that the problem was being caused by the ABS. After going through the
motions
with my local GM dealership, my suspicions that they would be useless
were
confirmed. The good 'ole boys looked at me like I was insane.

Eventually I found a person at GM's Milford facility that understood the
problem, and was kind enough to send me a new module to fix the problem.
After receiving and installing the new module, the problem on 146.53 was
gone.
However, I now had the problem at 146.58 Mhz, but that was okay.

On a related vein, I had a terrible problem with RFI getting in to by TX
signal
when I was using my Kenwood TS-690S in the truck. The antenna was
mounted on
the bed of the truck, and was well grounded, but I still had the
problem. I
tried clamp-on ferrite cores, and all sorts of voodoo, all to no avail.
After
doing some testing, I discovered the the cab was completely ungrounded
(probably
due to the rubber donuts that insulate the cab from the frame). I
installed a
heavy braided ground strap from one of the protruding seatbelt bolts and
a bolt
on the frame. This did the trick for me and may fix some anomolies
others are
having with GMC/Chevy pickups.

4946. Help! IC-901 No Xmit Audio

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-07 00:00:00 UTC
From: Rick Norton <rnorton@sprynet.com>
Message-ID: <5uvlka$h43$1@zinger.callamer.com>
Source record: 166675

I have a new, yes, new, IC-901 that I just installed. It is a multi-band configuration with several band units, trunk mounted with a 766 Remote Mounting kit. There is no transmit audio from the microphone, either voice or touchtone, when the microphone is front mounted. The PTT works, and I can "kerchunk" repeaters, so I know the PL is working also. When I climb into the trunk and connect the microphone to the "pigtail" hanging off the basic unit, everything works fine. Obviously, though, it makes it hard to drive the car!

Has anyone experienced this? Icom says to send the whole thing back, but the uninstall would kill me. I would appreciate information from 901 owners/users to aid in troubleshooting. Thanks in advance.

Rick Norton, WB2JIO

Mark:

I had a FT-50 and sold it after a couple of months. I then bought the
more expensive and slightly larget FT-51 and I love it. It is easier to
use. The keys have a solid tactile feel (they punch when you punch
them), unlike the FT-50 where you could punch a key without knowing it.
Also, the FT-50 has so many functions you can't keep track of them. The
FT-51 keypad is intuitive -- you can figure it out without the manusl

REceive audio on the FT-50 is superior but IMHO the FT-51 is the way to
go. It is, as you probably found out, more expensive. I think it's
worth the money.

Necesito que alguien que conozca o tenga este modelo de walki me indique
si originalmente no viene activada las frecuencias arriba de 440.
Intente en varias ocasiones activarlas (conforme el manual) sin exito.
Incluso los menus referentes a las caracteristicas de FM (del 30 en
adelante) no estan activados.
�Alguien sabe como se hace para activar estas funciones?.

Salu2 a todos...

KB8EE's 10 Minute ID'er. A software id'er written for Windows 95/NT only.
This program will not work in Windows 3.1!

The id'er allows you to display text of your choice in a window that also
displays the current time of day in am/pm, gmt, military(24 hr) or zulu.
The window also displays the time remaining until ID time. If the form is
minimized the time remaining is displayed on the task bar.

The current time, and ID times can be announced through your sound card
if you so desire.

Try it for free.

They all get hot. The smaller the radio, the worse the problem. The back
is the heat sink, and the less area ti dissipate heat, the hotter the radio
will be. Best solution is to buy a
mobile radio and use the portable as it was intended to be used.

From: ad4yj@aol.com
Message-ID: <19970907042800.AAA20539@ladder02.news.aol.com>
Source record: 166725

Actually, the UHF Mitrek is quite easy to convert, and they do work as
well as a GE MastrII as a repeater. I have had one on the air for about a
year now, and have had no problems. There is a glitch with the Preselector
on some of these, but it is an easy fix.
Later,
AD4YJ@AOL.COM

Source record: 166735

Hi all,

I have for sale a Marconi 202d RF signal generator. It has a calibrated output of 100MV to .1uV, is AM or FM modulated, and stable. It covers 50 MHZ to over 220 MHZ. Asking $150.00, I'll ship US.

This is a good signal generator for aligning 2 meter equipment.

4991. Dumb Question Time

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-07 00:00:00 UTC
From: Joe Denison N9ZLI <misto@iglou.com>
Message-ID: <Pine.GSO.3.96.970907051216.10612A-100000@iglou2>
Source record: 166739

I know that this is going to be a dumb question, so please don't patronize me about it. I know that the HTX-202 has no mods available for it. My question is about it's cousin, the HTX-404. Can this radio be modified to Tx/Rx in the satellite band below 440MHz? I have one that I picked up at a junk store and am wondering whether or not I can drop the frequency any.

Any response would be appreciated, but please e-mail me if you also happen to post it to this group as my connection is not the most reliable at this address (misto@iglou.com). I can be reached at n9zli@qsl.net or ksr612@aol.com though I prefer to use my IGLOU account.

THanks in advance,

Thats all they will do, Ive had one myself. I had one of those Standard
C508's also,- great radio, but even tho it dialed the higher frequencies it
was very deaf above about 470MHz

Try a FT50 if you want higher!

Cheers
Sean

I am looking for a used 70cm all mode rig for satellite work. This will be for a secondary station so I'm not looking for another 736R...one is enough. I also would like a brick for 70cm to add a little fire on the wire for AO-10.

Thanks and 73's,
Red

Date: 1997-09-07 00:00:00 UTC
From: K9JRI <k9jri@worldnet.att.net>
Message-ID: <5uutb5$pm5@bgtnsc02.worldnet.att.net>
Source record: 166754

Larry,

I was not very clear in my message. The later manual has been modified
to remove references to auto repeat above 146.995 mHz.

On page 53 a white stick-on paper has been added to cover the text:
147.000 to 147.395 MHz + (upper) shift
147.600 to 147.995 MHz - (lower) shift

Just "white out" that text in your manual and yours will look jsut like
mine and will accurately reflect how the radio functions. It DOES NOT
have auto repeat offset capability in the 147 mHz segment.

Sorry for my poor wording, and the typo, in my previous response.

I've found just the opposite! I've accidentally overwritten a memory I wanted to keep in a different band! My low tech solution is to write down what's in each memory :-(

Soapbox on:
In my world, the engineers (developers) usually prevail until the customer raise a stink. This should make them the primary candidates for layoffs when the product has to be redone later at great expense to match what the testers said in the first place! (Can you say "1-10-1000 rule?")

My Yaesu 5200 dual band mobile does this too! Apparently it's a Yaesu tradition. I usually copy a channel with the right offset, etc. to the vfo, modify the settings, then write them to memory. If you're only doing a frequency change, it's faster.

:snip

> 5. The VX-1R speaker audio is a little on the short side for

Sounds great when plugged into an external speaker. Some bands sound better than others. As you indicate, the laws of acoustic physics apply.

> 6. The MH-34 Speaker/Microphone has poor TX audio quality and
> does sound worse than the units own microphone.

I use an MFJ speaker mike with the Yaesu adapter with good results.

:snip

> I made a call to the Yaesu folks and was given the "it isn't a BUG
> treatment" and "We don't plan to fix our problems" tunes. Of course
> this was after an hour of telephone wait time on my dime.

This same attitude is why I'll _NEVER_ buy any Kenwood equipment...

> So buyers BEWARE this is what you get!!

No matter how hard I study a new piece of equipment, it always has some compromise that I find after I buy it. I don't like the fact that it scans only one band at a time, but my wife loves it otherwise (it's hers), especially the TV band! We'll just have to wait for that Dick Tracy wrist tv thing (sigh)...
My peeve to add to the list is this:

Why can't manufacturers come up with a _standard_ for power plugs? Maybe one for 3 volts, 6 volts, 9 volts, 12 volts, etc? Center positive or negative? The plug configuration could automatically set the adapter to the correct voltage.

I tried to go to Radio Shack to buy an adapter for one of my existing plugs, but none fit this radio! I went ahead and bought the Yaesu DC power adapter. Now I have one for my cell phone, one for my 2.5" tv, one for my Icom radio, one for my Sony disc player, ad nauseum! More than 10-15 bucks for a cigarette lighter plug is pure robbery!

Then, to add insult to injury they have a _four conductor_ mic/speaker plug????? I know the radio's small, but there's room for _standard_ mic/speaker plugs with a little effort!

Quite some time ago, before I bought my FT-50, I thought I saw a mod to widen the wide FM receive. Does anyone recall such a mod?

Thanks
Joel

5013. FT920 and software

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-08 00:00:00 UTC
From: mdowning@amberjack.rdatasys.com
Message-ID: <5v1pge$tu4$1@herring.rdatasys.com>
Source record: 166561

I am interested in comments about support for the FT920 in logging software. As of today, I am aware that TRlog and DX4Windows both support the FT920, and it looks like RTTY by WF1B will support it soon. It appears to be unlikely that Logwindows will support the FT920 in the near future.

Please send me your comments via email.

> I made a call to the Yaesu folks and was given the "it isn't a BUG
> treatment" and "We don't plan to fix our problems" tunes. Of course
> this was after an hour of telephone wait time on my dime.

This same attitude is why I'll _NEVER_ buy any Kenwood equipment...

> So buyers BEWARE this is what you get!!

No matter how hard I study a new piece of equipment, it always has some compromise that I find after I buy it. I don't like the fact that it scans only one band at a time, but my wife loves it otherwise (it's hers), especially the TV band! We'll just have to wait for that Dick Tracy wrist tv thing (sigh)...
My peeve to add to the list is this:

Why can't manufacturers come up with a _standard_ for power plugs? Maybe one for 3 volts, 6 volts, 9 volts, 12 volts, etc? Center positive or negative? The plug configuration could automatically set the adapter to the correct voltage.

I tried to go to Radio Shack to buy an adapter for one of my existing plugs, but none fit this radio! I went ahead and bought the Yaesu DC power adapter. Now I have one for my cell phone, one for my 2.5" tv, one for my Icom radio, one for my Sony disc player, ad nauseum! More than 10-15 bucks for a cigarette lighter plug is pure robbery!

Then, to add insult to injury they have a _four conductor_ mic/speaker plug????? I know the radio's small, but there's room for _standard_ mic/speaker plugs with a little effort!

> Where did the term HAM come from? When did it come to popular use?

The *real* explanation appears to be lost in the mists of time. There are a number of theories. Some more plausible than others. The one you'll likely hear the most is about "little station HAM". It goes like this. In the early days of radio, the government didn't assign call letters to amateurs. They just made up their own. Supposedly, three students at Harvard named Hyman, Almay, and Murray set up a station. They decided to use their initials as the call. Thus we have the little station HAM. When the Navy tried to grab control of all radio frequencies, these guys are supposed to have testified before Congress, and the story of little station HAM supposedly didn't leave a dry eye in the house. The press is supposed to have picked up this story of little station HAM, and amateurs have been known as hams ever since.

Unfortunately for this story, none of it checks out. A past president of the ARRL did extensive research in an attempt to confirm this story. There is nothing in the Congressional record about little station HAM. There is nothing in contemporary press records. And there is no record of a Hyman, Almay, or Murray at Harvard at the time this supposedly happened. This story first surfaced in an amateur publication in 1948, and doesn't seem likely to die. But it appears to have no factual basis.

Another story you may hear is that ham is the result of a Cockney pronounciation of (h)amateur. But that is unlikely for two reasons. First, the term was in use in America before there was substantial amateur activity in Britian. And second, voice transmission wasn't used by amateurs of the era, so how did a pronounciation get propagated by Morse?

Another story you may hear is that it comes from a landline telegrapher's insult. Many operators of the day came from a landline background, and on the landlines a common insult was that someone was "ham fisted" in his sending. It is possible that commerical operators used this slang to refer to amateurs and it caught on. Certainly, the term LID came from landline telegrapher slang. (LID was a reference to use of a tobacco can lid on the sounder to aid a poor operator in copying Morse.) This one may be true. It wouldn't be the first time that a group adopted a term originally meant as an insult to serve as a slang term for themselves.

But the one I like best goes like this. This era was filled with pulp magazines catering to the experimenter. (Everyone at the end of

the Victorian age apparently viewed himself as a closet inventor or tinkerer.) One of these magazines was called Home Amateur Mechanic, and it featured many simple radio sets a person could build. It is likely that when asked what kind of radio an operator was using, he might send back RIG HR ES HAM, meaning that it was one of the circuits shown in Home Amateur Mechanic magazine. Since telegraphers tend to abbreviate everything, due to the low throughput of Morse, this is plausible, and Home Amateur Mechanic magazine certainly did exist in the correct era. So it was those HAM radios which started the use of ham in amateur radio.

[SNIP!!]

Dave, isn't there some way whereas you can send these files via PRIVATE EMAIL *ONLY* TO THOSE WHO WANT IT instead of posting it in a PUBLIC forum for EVERYONE to have to download ALONG WITH ALL THE OTHER ARTICLES we get???

Do you even know how much bandwidth you consumed while transmitting these files???? I don't, but I'd be willing to bet the needle fell OFF THE METER!!!

I don't mean to sound critical or harsh, but at least IMHO Dave, you surely didn't use very good judgement nor netiquette.

For the benefit of all of us, PLEASE, next time you have a file like this, do us all a GIANT favor.....

Send it only to those who want it!!!! It'll save the HD space for those who don't want it, but need the space for other things besides a newsreader.

I do hope you take this as CONSTRUCTIVE criticism as no offense is meant nor taken on my part.

73's for now my friends!!! :-)

I beleive that the APA (American Psychology Association) standard, which
is used by many of the non-technical fields now says to use _one_ space
following a full stop. I don't know why they made the change, and I
don't know if any of the other writing standards have also changed. I
don't necessarily agree with the change, but I also don't think it
really matters.

M$ Word doesn't throw away the second space, but it does want to
misspell words like colour and centre. ;-)

Hello..

I'm still working on my GE MVP UHF radio to use as a repeater. Does anyone have any documentation that has what the voltages on the connectors (on all the SAS board sockets) should be? There are three main connectors onto that board, and I have voltages, but don't know if these are correct or what. If I knew, then I'd be able to possibly fnd my problem.

Yet is right. When "WE THE PEOPLE" begin to think too much, and
then we talk about it via the web, suddenly, new rules will be made.

No right minded American is going to resort to bombs. We do have a
major developing problem. It is that our government is becoming out of
control and more dangerous to our health and freedoms, but we still have
time to simply change it. No force is needed. Marching in the streets
is not a bad idea, but only peacefull marches. Let Big Brother be
guilty of excessive force.

5040. ICOM IC-820 EXTENDED RECIEVE

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-08 00:00:00 UTC
From: Paul Anderson <p.e.anderson@lucent.com>
Message-ID: <34145C49.4520@lucent.com>
Source record: 166588

Does anyone out there know of a mod to the ICOM IC-820 (VHF UHF all mode rig) that will extend the VHF recieve range? I'm interested in the aircraft band 118 to 130 Mhz or there abouts. Hopefully its one of those hold down 3 front panel keys and power it up sort of things but if not I'll get inside it, if need be.

THANKS

Paul Anderson WB0ZRD at Lucent Technologies-Bell Labs Denver, Colorado

Content-Transfer-Encoding: 7BIT

KB8EE's 10 Minute ID'er. A software id'er written for Windows 95/NT only.
This program will not work in Windows 3.1!

The id'er allows you to display text of your choice in a window that also
displays the current time of day in am/pm, gmt, military(24 hr) or zulu.
The window also displays the time remaining until ID time. If the form is
minimized the time remaining is displayed on the task bar.

The current time, and ID times can be announced through your sound card
if you so desire.

You must download the hcsnd95.dll file for the audio portion of the
program to function.

Try it for free.

Surely you jest.

Those VX-1R "bugs" are simply misdirected "design features".

IMHO the VX-1R does exactly what the designers (or the spec writers)
intended.

Such lousy intentions, though!

Phil

I have a Rohn HBX56 56 foot free standing tower for sale. Some rust but in
good condition. This tower will fit in the back of a small pick-up truck
with no problem,
approximatly 400 lbs. Includes thrust bearing on top section. Asking $200,
you pick up in Chillicothe, Ohio.

From: "Rick Norton" <rnorton@sprynet.com>
Subject: Help! IC-901 No Xmit Audio

I have a new, yes, new, IC-901 that I just installed. It is a multi-band
configuration with several band units, trunk mounted with a 766 Remote
Mounting kit. There is no transmit audio from the microphone, either voice
or touchtone, when the microphone is front mounted. The PTT works, and I

can "kerchunk" repeaters, so I know the PL is working also. When I climb into the trunk and connect the microphone to the "pigtail" hanging off the basic unit, everything works fine. Obviously, though, it makes it hard to drive the car!

Has anyone experienced this? Icom says to send the whole thing back, but the uninstall would kill me. I would appreciate information from 901 owners/users to aid in troubleshooting. Thanks in advance.

> > > > Tim KF8XW
I had a similar problem with my 92 GMC pickup. Mine was evident at
146.53 Mhz,

which made using .52 simplex impossible. By pulling fuses, I was able
to determine
that the problem was being caused by the ABS. After going through the
motions
with my local GM dealership, my suspicions that they would be useless
were
confirmed. The good 'ole boys looked at me like I was insane.

Eventually I found a person at GM's Milford facility that understood the
problem, and was kind enough to send me a new module to fix the problem.
After receiving and installing the new module, the problem on 146.53 was
gone.
However, I now had the problem at 146.58 Mhz, but that was okay.

On a related vein, I had a terrible problem with RFI getting in to by TX
signal
when I was using my Kenwood TS-690S in the truck. The antenna was
mounted on
the bed of the truck, and was well grounded, but I still had the
problem. I
tried clamp-on ferrite cores, and all sorts of voodoo, all to no avail.
After
doing some testing, I discovered the the cab was completely ungrounded
(probably
due to the rubber donuts that insulate the cab from the frame). I
installed a
heavy braided ground strap from one of the protruding seatbelt bolts and
a bolt
on the frame. This did the trick for me and may fix some anomolies
others are
having with GMC/Chevy pickups.

: capability?

: Joe, K5HLR

According to the picture of ic-746, You can know the size of the transceiver
by comparing the size of the 8 pin mic socket at the left bottom of the panel.

The height may same as ic-756 and the width may 2/3 width of ic-756.

From: scothar@c2i2.com
Subject: FS Azden PCS-2000 2m Mobile

I have an Azden PCS-2000 2m FM mobile radio for sale. The radio is in excellent condition. Features include: 6 memories, 25W output, detachable face, LED frequency display, memory/band scan, etc. The microphone has up/down frequency control as well as volume and squelch control. I do not have the manual or the mobile bracket.

I'm asking $150 shipped -- will consider all offers.

Date: Sat, 6 Sep 1997 13:04:04 GMT
From: Stanley Perkins <stan@netcom.com>
Subject: Heath Most Accurate Clock

One other thing I found out about the Heath GC-1000:

The 3.6 MHz crystal timebase is electronically steered by the microprocessor according to the data it accumulates from WWV. The idea is that during signal outages, the internal timebase will keep the clock from drifting a whole lot. So far, so good. BUT...

The voltage of the +5V bus (which is also the voltage presented to the steering circuitry) depends on the position of the display switch on the left side of the clock. If the display is on, it's one voltage, if the display is off, it's a different voltage, and the timebase shifts a significant amount.

After a bit of head-scratching, I found a quick and easy fix for this. The display switch still works, but the timebase is unaffected. Better yet, it takes ony a minute or two to perform. Even better, it doesn't

involve any irreversible modifactions to the clock (for you purists out there!). It involves removing one of the display board ICs, bending one pin so it's sticks out at 90 degrees to the rest of them (so it no longer goes into the socket), and then replacing it. It's pin 16 of the IC mounted directly below the "Hi Spec" LED (U101, an MC14543). Of course, this needs to be done *only* if you turn the display on and off. Otherwise, the +5V supply never changes, and the oscillator ssets itself up accordingly.

Hope this helps!

Regards,
Stan

> > I have a Kenwood TH-79A and it gets hot

In addition to the other useful responses here, may I add this:

If the HT gets hot, it could also indicate a poor antenna
match. Borrow or buy a cheap SWR meter and verify that
you are getting a 1.5:1 or better match. If it's higher,
you may be dissipating your power inside the radio, instead
of radiating it to the world.

Subject: Kenwood TH-79A gets HOT

They all get hot. The smaller the radio, the worse the problem. The back
is the heat sink, and the less area ti dissipate heat, the hotter the radio
will be. Best solution is to buy a
mobile radio and use the portable as it was intended to be used.

Subject: My comments on the MFJ-418 Pocket Morse Code Tutor

Everything said about the MFJ-418 --I agree. For me it was the best tool
for getting to 13 wpm and passing the exam. I didn't use my computer
program after I got it, the 418 is so convenient. You tend to study more
with it.

I have seen it for $75. It probably has a good resale, so net cost to
pass might be $20-30; well worth it.

: Joe, K5HLR

According to the picture of ic-746, You can know the size of the transceiver
by comparing the size of the 8 pin mic socket at the left bottom of the panel.

The height may same as ic-756 and the width may 2/3 width of ic-756.

I believe the radio will put out either 50 watts or 100 watts on 2 mtrs
The brochure says 50 watts with a * and 100 watts. maybe modifiable.
Also, according to several people who attended the Japan Radio Fair,
the IC-746 is TRIPLE CONVERSION and has TWIN PASSBAND TUNING.
I am waiting for it in the USA market. Oh, Icom USA says they are not
sure if the radio will be just for Japan or worldwide. First, they say
this as to move the older model off the Dealer shelves. Second, they
denied the Existence of the ICOM 706 Mark II till wit was on the
Japanese Web page. Don't get suckered into an older model folks.
The Icom 706 MK II was supposed to have DSP (look at the Display at an
angle.. you can see "DSP, NR "). Icom says maybe another model was going
to share the same Display. RIGHT.. If you believe that I want to sell
you the Brooklin Bridge. Icom couldn't get the DSP to work on 2 mtrs
in time and decide to release the radio minus DSP.
If Icom USA doesn't want to sell the radio in the USA then I have
4 Japanese Radio Dealers with Web sites that would be happy to sell the
radio to you.

So what is your point Gary. Did this fella use your money to buy this
nice radio. If so then I guess you can tell him what he can or cannot do
with it. My opinion is that if a person wants to spend that kind of
money on a radio to use on 11 meters then so be it.
Just my opinion!!!!!!

KB8EE's 10 Minute ID'er. A software id'er written for Windows 95/NT only.
This program will not work in Windows 3.1!

The id'er allows you to display text of your choice in a window that also
displays the current time of day in am/pm, gmt, military(24 hr) or zulu.
The window also displays the time remaining until ID time. If the form is
minimized the time remaining is displayed on the task bar.

The current time, and ID times can be announced through your sound card
if you so desire.

Try it for free.

am considering buying a butternet "Butterfly Beam" that promises
operation on 20,17,15,10 meters with varrying amounts of gain.
Any comments on usefulness? I have heard that the antenna is hard to tune. Is this
true?

with the implication that the font spacing specs would take care of the
spacing 'properly', according to convention

wrong! On my Microsludge Windows and WP software, the TrueType fonts
appear to have exactly the same spacing for comma, stop and colon

(Only one full-stop, except where mandatory in addresses, with apologies
to John Woodgate in case he meant something else. :=))

5067. MFJ 9020 Help Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-08 00:00:00 UTC
From: "Ronald D. Lucier" <optics3d@ix.netcom.com>
Message-ID: <3413F4FF.7E5@ix.netcom.com>
Source record: 166626

I have an intermittent problem with this QRP cw rig - it drifts and/or chirps every now and then. MFJ wants $50 + shipping to fix it. Being a Mechanical Engineer by trade and having limited test equipment, I'd like help in identifying where I could start looking for the suspect component. I believe it is the VFO Cal coil but I'm not sure.

The other bothersome thing is the very low audio from the speaker. It's ok if I run it through a DSP unit but most of the time I want to backpack it.

Anyone out in the ether that could help? Anyone elese run into this as well? Worked 40+ DXCC countries with only a dipole so far!

VEWY VEWY SIMPLE.
WP sees a period (since abreviations invariably end in one) and
determines the next word to be the beginning of a new sentance. As
such, it must be capitalized. You can always tell when an illiterate
or semi-litterate is using a spell checker/grammar checker because the
always believe the computer - and get everything wrong.

I'm not an engineer, but have been involved in technical education over the years. I taught automotive mechanics for several years. The system thought that was where to put the guys who were boarderline. I'll tell you, it was exactly the wrong place. Those mechanics today that could not figure out the basics of ohm's law, magnetism, current flow, hydraulics, boolean logic, etc are in a real tight spot today.
The basic theoretical knowledge MUST be combined with the basic hands on experience in ANY technical education. In order to fix anything, or design it, you must first know the principals involved, and how they apply. If you do not know how it is supposed to work, you do not know, #1, if it is working properly, #2, why it is not, if it is not, and #3, how to fix it.

The engineer can always tell the tech what is wrong, and let the tech turn the wrench, but the tech has to know what is going on because, in most cases, the engineer is out of reach.

I am still a proponent of teaching the basics at a basic level of education, and the details in more advanced levals. Creat a gereralist first, then develop a specialist.

Those with a broad based education, covering all the bases, are the ones who will survive todays job market.

Source record: 166635

Hi Ron--

> I'd like help in identifying where I could start looking for the suspect
>component. I believe it is the VFO Cal coil but I'm not sure.

From my experience, the chirp probably isn't being caused by the VFO coil. I'm more inclined to suspect the transmit local oscillator crystal (Y6) is mode jumping (suddenly changing frequency). This happens to some crystals when they are operated with a lot of L (coil inductance) in series. There's a 15 uH choke in series with the crystal (L5), and this may be enough to bother a marginal crystal (the early 40-meter transceivers had enough of a problem with this to prompt us to decrease the value of the series choke). It is rare on the 20-meter units, but it CAN happen.

There are three potential solutions. (1) change the crystal. (2) ground the crystal case to the adjacent coil can with a short piece of wire (works about 50% of the time)--or--(3) reduce the value of the series choke to 10 uH.

The VFO drift could be attributed to a couple of things--depending upon when the radio was built. All of these radios experience some short-term warm-up drift in the first 10-15 minutes of operation. This is due to component heating of the parts in the VFO tank when the radio is energized. After that, some experience long-term thermal drift and others do not--depending what parts are used in the VFO (the newer ones should exhibit little or no significant long-term drift due to ambient temperature change). To answer that question, I would need to know if the VFO coil (L3) is a Coilcraft coil (hex slug, no markings on top) or a Toko coil (slotted slug, lettering on top of can). Also, what kind of capacitors are C32 and C33. Are they polystyrene or multilayer (ie.) round clear plastic or small and blue)?

Finally, check the supply voltage to your AF amplifier chip (pin 6 of U4--LM386). If it is down around 10 Volts, then you have an older radio--and there's a modification that will connect its plus line directly to the 12 volt unregulated line (through R38). This increases the radio's AF output. Also, try jumpering R27--this will increase IF gain.

I presume the radio is out of warrantee, or it would be fully covered in the first year (MFJ's no-matter what warrantee). If you need specific parts to cure these problems, ask customer service to send them to you. If they can't or won't for any reason, contact me by E-mail and I'll see that you get them.

Glad you are having fun with the rig. Hope this helps.

Hello,

I have two Maxtrac D45MJA... 800Mhz, High Power for sale. I bought
them at a hamfest thinking that they were UHF !! (Oh well ...)

Is it worth anything ?

Hi Dean, that's what my elmer told me in the early 1950's. Also there's
a word-origin column called "Word For Word" that appears in some
newspapers.
A column from years ago sez, "A 'ham' radio operator is certainly a play
on
the word 'amateur'. The term was coined in the 1920s."

Thanks everyone for the info. I've direct emailed some of you.

I've done a RF scan of my truck using an FT530 with an 80 dB step attenuator feed by a coax probe with a 1" dia loop on the end. The signal scale on the HT is not calibrated so take my measurements for what they're worth.

1. The 147.40 approx signal is full quieting when probing near just about any wire on the truck anywhere and also on many metal structures.

2. I attenuated the signal by -10dB to get it down to just full scale on the HT. Then I tracked the strongest levels down to the ABS braking unit. Then I attenuated down another 20dB (-30dB total) to keep the level down around the ABS unit.

3. The strongest signals were located near the center of the ABS unit's black sealed cover. Interestingly there is a 1 foot square foil sheet bonded to the underside of the hood directly above the ABS unit (Hmmmm-what system is benefitting from that shielding?)

The strongest signal level I found required -33dB attenuation to get the receiver to become slightly noisy (no longer full quieting) and about -38 to -40 dB to get to the highest noise level, same as removing the antenna altogether produces (with squelch open). In other words it appears that the ABS unit RFI is 40 dB above the noise. This seems like a substantial signal level. In watts, I dont know what that would be.

I may try to shield the ABS unit, but from some postings that doesnt seem too hopeful.

Hello,
Please forgive me if this is a bit off topic. It occurred to me a few days ago that those wanting to buy used ham equipment might have a difficult time locating online swapfests. I did a few searches and didn't come up with very many though I know full well that there are a lot out there.
It also occurred to me that perhaps I could gather a list and turn it into a "page o' links" for my homepage to benefit anyone visiting it.
So, my request is that if you either run or know of an online swapfest please send me the URL. I'll check out those I can, based on the number of responses, and create links to the best 10 or 20 on my homepage.
Sound good?
Thanks.

If, as indeed you should, you put a full stop after abbreviations, it
probably thinks (!) that you're starting a new sentance. At least it's
not PC like Word, which keeps on telling me I should use 'spouse'
where I've written 'husband'.

I need Info on purchasing or building wind speed, direction, temp, is
it wet, when, etc to connect to a radio to send data to me or, log
file to hard drive so I can retrieve it several tiimes a year.
I prefer the former.Then maybe We can put a repeater up there.

I am looking for service manuals for these units, AND info on modifications into amateur bands for possible repeaters. please send any info to me at n2roq@juno.com tnx, 73's Ben

5111. FORSALE - Immaculate Kenwood TS-520, great starter rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-09 00:00:00 UTC
From: jpl@qc10.ho.lucent.com
Message-ID: <5v4b44$7d9@nntpa.cb.lucent.com>
Source record: 166463
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,nj.forsale

I have a virtually immaculate Kenwoods TS-520 rig that I would like to sell.
This was my first "real radio and in my opintion is still
one of the best rigs around. It would make a fantastic beginner
station or a great backup rig.

I am only the second owner of the rig.
I purchased it from a collegue of mine at Bell Labs (who
was the original owner), and I have the orignal sales receipt,
boxes, and manual for it. Both he and I took
exceptionally good care of this rig. It has NEVER been in a smoking
environment and has NEVER been mobiled.

For any novices not familiar with this radio, it is all solid state
(discrete components, so its very easy to repair if ever needed)
except for a tube driver and a pair of very
robust 6146 tubes as the finals. It has a builit in power supply,
but can also run off of 12VDC.
It covers 80,40,20,15, and 10 meters in CW and SSB (upper and lower) modes.
The receiver section is excellent and I always get excellent audio quality
reports. Many folks say that these older Kenwoods are some of the best
sounding rigs on the air.

This rig also has the optional 500Hz CW filter
installed (genuine Kenwood option).

The price is $300 firm + shipping. You might find one for a few $ less,
but NOT is this great condition. Also have a DG-5 digital display which
I will sell with the rig only for an additional $75.

i have found Rangers to be very good mobile use radios.
i prefer the 2970 due to it's more powerful output.

i used one for almost a year in my buick and loved it.
i used a d104 M6 microphone with it [liked the tone better]

i removed it from service after i bought an ic 706.

From: hershman <hershman@ix.netcom.com>
Message-ID: <3415DE47.79DC@ix.netcom.com>
Source record: 166467

Got a credible source that said the ICOM 746 will be available in the United States by January 1998. Don't count on it by Christmas. It is worth the wait.
Icom USA sent me messages saying they are not sure if the Ic-746 will ever be offered in the USA. DON't Believe them. They are playing Dumb and want to clear out the IC-756 before the IC-746 is advertised.
I know the USA price will be $1650 to $1700 USA DOllars!
I will not reviel my SOURCE even under Torture! I will buy it over the IC-756 since it is smaller and has 2 meters all mode at 50 watts.

rec.radio.amateur.equipment

Stop HR2369!

A new proposed bill has the potential to eliminate the scanner industry, as well as greatly affect other radio services, such as amateur radio, MARS, CAP, news media, and radio hobbyists activities.

** Contact your local Congressional representative and voice your opposition to HR2369. If passed, this bill will make it illegal to sell, trade, manufacture or modify any radio receiver with certain restricted frequencies. Wide band amateur radio transceivers will become illegal, as well as general hobbyists who monitor fire, ambulance, and police radio services.

It will also be a crime to own such radio receivers and to listen to these frequencies. Violators will be subject to up to a $500,000 fine and up to 5 years in prison, or both!

For more information, please visit our web site at http://kb8uyz.com, where, under the Radio News section, we have the complete bill posted. Also check out the Grove, Monitoring Times web site at http://www.grove.net/mt2369fea.html. A complete background to the bill is listed.

Please let us hear your comments on this new bill. We will be posting a page of viewer comments within the next several days.

If you get them please post for the rest of us "BLOKES".
I heard the TX expand mod is done by cutting a trace on a PC PCB.

5129. Yaesu VX-1R Comments Requested

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-09 00:00:00 UTC
From: Bob <bob@huskers.com>
Message-ID: <341616E4.6DF4@huskers.com>
Source record: 166481

I am considering purchasing a Yaesu VX-1R. I just purchased an Icom IC-W32A, which replaced an Icom IC-T7a that did not work correctly even after two units, and decided the W32 is too big and heavy. I want a small and light dual band ht and the VX-1R appears to fit the requirement. The Yaesu FT-50 is also too heavy. I currently have an Icom IC-P4AT and it is about the right size and weight, but only a single band HT.

My question is: I have seen a couple of articles that weren't very good about the new rig on this newsgroup and wanted to get a few more opinions. My requirements are: To use it for VHF and UHF ham, and to use it for out of band on UHF as I have commercial repeaters I want to monitor and occasionally talk on too, to maybe listen to a commercial FM radio station (wide FM feature). I take long walks, and need it to be as light weight as a dual bander can be. Living in Lincoln Nebraska not a whole lot of power is needed to get to the local repeaters, so the low power out does not seem to matter.

So thank you in advance for your comments.

Bob Eastwood

When radio was being developed at the turn of the century, and the fcc
was created, commercial interests wanted all the frequencies. However
certain portions of the high frequency band were allocated to amateur
radio enthusiasts for experimentation, the feeling being that they could
never develop radios that would transmit more than a few miles.
Thus, HAM stands for High frequency AMateur.
Anyone got one better?

> See it at http://www.drele.com

You are wrong about the TRC-80. I talked to the Kenwood
representatives, the TRC-80 has been around for along time (more than 5
years). It was meant for export only and is not sold as an amateur
radio (although www.drele.com advertises as such). You can not purchase
it in the U.S. period.

So, I wanted to make sure that this thread did not get to far. I guess
this is how rumors get started.

> 73's NS1R Steven Hershman

The TRC-80 is not sold in the U.S. at all! I talked to the Kenwoood representatives and the TRC-80 has been around for more than 5 years now. It is sold only as an export and mostly in South Africa. So, unless you intend to operate legal frequencies in South Africa (or Greece), don't buy one.

If you don't believe it, try to buy one in the U.S. and if you do get one here in the U.S. you will not get any modification information for this model to accomodate our frequency allocations.

This is NOT a replacement for the TS-140S. I just wanted to make sure that false rumors were not spread any further. I am sure Steven Hershmans intentions were good, but it is not true. Oh well...

The AC charger for the VX-1R supplies regulated 6V DC, but with a
tightly set current limit of 600mA. I agree that a Volkswagen DC lead
would end up doing some major damage......

Chris.

Source record: 166496

The front face of my Kenwood TM-V7 is so shiny when I look at it during the day all I see is reflections of my car interior. The plastic face should have been designed with a plastic that doesn't reflect so well.

Anyone find a way of improving this? It is really dangerous during the day to try to see the radio display.

Well, I *may* have gotten it right, Mark. It is certainly a plausible
explanation. We don't know definitively, however. A lot of folks
have tried to track down and document the origin of the term, but
no one has been able to discover who used it first or why.

Source record: 166509

Hi,

It happend to me. I believe the radio is more prone to it when it is modified. The best thing to do is send it back to Yaesu and have them fix it. You might try resetting the CPU. Then make sure that the radio is off the entire time that the car it is installed in is cranking to start that the radio is disconnected from the battery or positive source. I did this using an automotive relay, and connecting the positive control wire for the coil to a fuse that I made sure was completely off while cranking. I believe that the windshield wiper fuse is good, but make sure you check. I believ it happens due to a voltage spike.
Good luck.

Mike

A base 64 decoder such as SJHb64 will decode it.
Just save all the parts into one file and use the decoder.

: transmitting and recieving CW signals? I am a new ham and wanted to

I am surprised to see no answers to your posting so far - guess since
you didn't have a WTB or a FS in the subject no one was interested !

The best I have ever used is a Yaesu 1000MP. The QSK (full break in)
is superb. There are no relays clicking away and you can hear the
other stations almost as if you werent even transmitting. It has
to be experienced to be believed.

> Thanks!!

This is absolutely amazing! It is hard to believe that David Abrams has
actually posted something of relevance to the radio newsgroups. If he were
any old newby, I would say that he would deserve a polite and helpful reply.
However, he is one of the worst and most flagrant posters of irrelevant
political diatribes in these newsgroups. The explanation by Steve S is
correct. If he had had any kind of reasonable education, he would be able
to understand what Steve S wrote. Now he displays his ignorance and
incompetence in radio related areas. It goes well with his inability to
show some maturity and self-restraint by keeping his political postings
to appropriate newsgroups. Or maybe he has tried that and could not keep
up with the arguments, so he wandered off thinking he could impress us
with his knowledge as he shows off his stupidity.

I'm sure that this was discussed in the RSGB's Radio Communication
magazine some years ago but I'm not about to start digging through the
pile in the attic!! From what I remember "Ham" is derived from the
acting profession, a "ham actor" basically being a poor one. My Concise
Oxford dictionary certainly agrees with this, " an inexperienced or
ineffective actor, one who rants and raves"! IIRC from the Radcom
discussion the acting term came from the fact that the early greasepaint
used as makeup was based on pig grease - hence "ham"!

I expect we'll never learn the real origin but I learned something from
this discussion, although I haven't heard the term "lid" for years I
always wondered what it came from, mni tks to tt poster!

> him with millions of dollars worth of projects?" It's a scary thought....

The true test of an engineer or a technicians work has little to do with
the number of alphanumeric symols they place after their name, but a
hell of a lot on what they can / have done.

We are so hung up on "classification" that more often than not we pass
up on excellent people because they do not fit the mold.

As a former mechanic I coud fill a book on various "engineering" errors
that got loose into the retail market, that were fixed by both customers
and trades people alike. A classic was the briliant idea to use
alluminum wire on an automotive application, a disaster to say the
least. This is not to say there was any incompetancy, nnly that often
the "simple" things are overlooked.

One of the best mechanics I ever met could neither read nor write, yet
the man could fix just about anything you threw at him. Natural talent,
you bet. But he was lucky, he was already recognized for what he could
do, by the time they put into place the rules / regulations we have
today. In this day and age he would not even get the chance to
demonstrate what he could do.....

I agree that a sound education in ones field of endevour is the most
useful of tools the person will ever get. And that the more
comprehensive the training the more advanced work the person will be
able to handle over a short time. But at the same time we need to leave
doors open to access the other side of the coin, those individuals who
do not have solid accademic training, but a natural nose for the field.

The term "Ham" is intensley disliked by many UK Amateur operators -
Where on earth did you get the idea that the term was in use before
there was *substantial* amateur activity in Britain. The UK has a
proud history of radio experimentation preceding the introduction of
the word Ham.

The Concise Oxford Dictionary has it as slang for an amateur, as in ham
actor. It also mentions the terms ham-handed and ham-fisted, for someone
who is clumsy. This is probably why "ham" isn't used much by radio
amateurs in the UK. You *never* see the word in RadCom, unlike QST.

I picked up a Cornell Dublier BT-1 (Big Talk One) rotor at a recent hamfest. The comparator chip in it is hosed. Unfortunately, it is maked with a 'house' number instead of the generic one.

A call to Telex gets a response that they no longer stock this part.

Any of you more astute individuals out there have the generic part number. Would be nice if it were a simple '741 wouldn't it......

Source record: 166535

Does anyone else here get hacked when they find these huge binary files in their email box because someone has decided to send their favorite ham-related program or image to the ham-equip remailer?

I'm sure these items (like pictures of the IC-746 or the "10 minute id'er") are of tremendous value to some but NOT TO ME. Sending them to the whole group is, in my humble o, an imposition on those who do not wish to receive them. Wading through the continual for sale ads and the seemingly never-ending insult exchanges is one thing....these huge files are another all together.

Hey, there, OFs, if you have a picture or a program to share, how about posting it to a web site and then informing us of the URL, or sending them to individuals who request them, instead of just broadcasting the things to the group and forcing all of us to receive them. Thanks.

I recently posted binary files to this newsgroup. I should have polished up on the newgroup guidlines before doing so. I was in error and I apologize.

To those of you who responded with a polite way of telling me of my mistake, thank you very much.

For those of you who walk on water, kiss my ass. If someone makes a mistake, tell them of their mistake, don't get on your high horse. I thought, just maybe, you jerks wouldn't migrate to the internet.

5179. Glass Mount Ant.

Hello:

I have a glass mount antenna from Larsen. I am going to sell my truck that it is on and I would like to know if any body knows of an easy way to remove it from the window. You can email me at rjagoe@nbnet.nb.ca. Thanks

Ryan

5180. Re: Yaesu FT-990 Help Please

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-09 00:00:00 UTC
From: Dale Wentz <dwentz@accessus.net>
Message-ID: <01bcbd13$022a82e0$a32404d0@dragon.mcs.accessus.net>
Source record: 166539

I would like to thank everyone that sent me info on the FT-990 filters.

I received many messages, and all indications are that I have the correct filter, and that Yaesu part number on the box and filter are different.

Once again thank to everyone that responded. Only in the Ham Radio News Groups could I get such fast, and accurate information.

From: Phil Wheeler
Subject: Any VX-1R Bug FAQs?

Surely you jest.

Those VX-1R "bugs" are simply misdirected "design features".

IMHO the VX-1R does exactly what the designers (or the spec writers)
intended.

Such lousy intentions, though!

Phil

From: bravin@power-agents.com
Subject: BEING BALD IS NO FUN!!

Hello,
Please forgive the intrusion, but if you're a man, or, if you have a man
in your life, this may be a most welcomed information.
No matter what anyone says to the contrary, we men know that
getting bald is a pretty devastating business. When someone says it doesn't
matter, chances are that that person has a full head of hair. In the Euro
-Western cultures losing your hair is like losing your manliness
and affects us men in different ways; from shooting down our self-
esteem and self confidence to fewer career/job promotion opportunities
to lessened romantic desirability...you know that helpless sinking feeling....

GOOD NEWS!! There is a natural cure for balding and hairloss....now you can
grow real hair.............DO YOU DESERVE TO LOOK AS VIRILE, AS MANLY,
AS YOUTHFUL AND AS SEXY AS YOU FEEL? ABSOLUTLY YES!!
For more info and to find out more about the GREAT FOLLICAL KILLER
simply go to:http://www.power-agents.com/~bravin/ you'll be thrilled
you did!
Again, forgive the intrusion, I will remove your name from all
future mailings if you reply with "remove" in the subject line,
thank you for your time, Indian Dan.

Subject: Best CW radio

: Over the years, has a model of radio proven to be the best at
: transmitting and recieving CW signals? I am a new ham and wanted to

I am surprised to see no answers to your posting so far - guess since
you didn't have a WTB or a FS in the subject no one was interested !

The best I have ever used is a Yaesu 1000MP. The QSK (full break in)
is superb. There are no relays clicking away and you can hear the
other stations almost as if you werent even transmitting. It has
to be experienced to be believed.

From: hq54@aol.com (HQ54)
Subject: Yeasu 2400 display problem

Hi,

It happend to me. I believe the radio is more prone to it when it is modified. The best thing to do is send it back to Yaesu and have them fix it. You might try resetting the CPU. Then make sure that the radio is off the entire time that the car it is installed in is cranking to start that the radio is disconnected from the battery or positive source. I did this using an automotive relay, and connecting the positive control wire for the coil to a fuse that I made sure was completely off while cranking. I believe that the windshield wiper fuse is good, but make sure you check. I believ it happens due to a voltage spike.
Good luck.

Mike

Patrick, I agree Dave shouldn't have posted the binaries here but perhaps you could save yourself some grief and and setup your newsreader to only get the *headers* and then select the ones you want to read/download, unless you have some good reason to download *ALL* of the postings without first seeing which ones are of interest to you. It took me about 2 seconds to download 60 some headers this morning which included some of Dave's big binaries.

Anybody has ADI AT-600 handheld ?

I would like to purchase it, so all "field experience" comments are more than welcome. Than You very much in advance!

Please contact me at following address (do not just reply on this message since return address is incorrect):

<ljubisic("at")EUnet.yu>

where ("at") equals @ sign, but I haven't use it since I receive a lot of "junk" e-mail every time I post something in any of newsgroups. Sorry for the inconvenience.

I'm curious as to what the receiver does on the IC-2710 both stock and modded (if it exists). The ICOM homepage claims the receiver is only up to 450MHz. Is this true? Please email reply any responses to n2zjj@amsat.org .. thank you.

Ryan,

Take a can of WD40 and spray around the base. As this soaks in, it will disolve the glue and you can start working it off. Keep applying until the base will easily come off.

Mark

5196. Tone decoder 2+2

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-09 00:00:00 UTC
From: rb8611@aol.com
Message-ID: <19970909194200.PAA08377@ladder01.news.aol.com>
Source record: 166555

I am looking for a source for a 2+2 tone decoder module.

In my county our vol fire department alarms are activated by the 9-1-1 center using Motorola Z series tones. Dept alarms are activated by a 2+2 tone and our pagers are activated by a 1+1 tone that is part of the 2+2 tone signal.

I am looking for a low cost decoder, programmable if possible, that I could install in a scanner or other reciever.

Any info will be greatly appreciated.

Bob

5198. FS: 23cm ATV setup

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-09 00:00:00 UTC
From: cmlong@mtu.edu
Message-ID: <5v42r2$fa7$1@techsrv1.tech>
Source record: 166557

Unfortunately the cost of going to college has caught up to me
and I must get rid of some of my toys :(I have the following
setup forsale and I will only sell it as a complete package:

1 - 23cm FM Transmitter for Video and Audio
Tunes the whole band, SMA connector on output.

1 - 1W Tron Tech amplifier with oversized heatsink
Model P26GA-1

1 - 18W Down East Microwave amplifier with repeater grade heatsink.
Model 2318PAHS

1 - Homebrew 23cm Preamp, has gains in the low 20dB range.

1 - Hewlett Packard Coaxial Relay, good from DC to 4GHz.
HP 33314A, SMA connections with hardline to connect from
the 18W brick and a SMA to female N hardline run for the
antenna connection.

Hardline connects the transmitter, and amplifiers together.
>From the transmitter to the 1W brick, SMA connectors are used,
>From the 1W brick is a SMA connector and into the 18W brick is a
N connector as is the output of the 18W brick.

1 - Microdyne receiver, Model CSD-BQR-1
Tunes whole band. Manual included.

1 - Microdyne receiver, Model 1-100-BKR
Tunes whole band. Manual included.

All schematics and notes are included on the setup. All one needs is
a camera, antenna, and 13.8V power supply for the transmitter and amplifiers
to get going.

All this for the low price of $500 plus shipping, firm.
Please email me if you are interested since I am rarely home while going
to school. My address is cmlong@mtu.edu

Thanks,
Mike

5200. VX1R charging circuit

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-09 00:00:00 UTC
From: Sean and Leigh <sean.nixon@ibm.net>
Message-ID: <341484b4.0@news1.ibm.net>
Source record: 166598

I discussed recently with someone how the charging circuit works with the vx1r.
Reason being i brought one in the US, and live in 240 volt land.

I supplied the unit with 6V, and it seems the current will keep increasing up towards an amp- so i would think some current limiting would be in order.
I let it charge at 500mA on a regulated supply with current limit, and then as it approached full charge the radio limited the charge by turnng he charging circuit on and off- the off time getting longer, and the on shorter as it became more charged.

Consequently, if you are a 6 volt volkswagon owner, I wouldn't make a cigarette lighter cable yourself to charge your vx1.

Cheers
Sean

They're probably being auto-cancelled. It's generally considered to
be very bad manners to post binaries in a discussion group. Therefore,
there are 'bots out there that cancel them.

If you want to distribute software, you should post a message
indicating where the software can be found on the net - either an
FTP site or a web page. Discussion groups are NOT for software
distribution.

Thanks everyone for the info. I've direct emailed some of you.

I've done a RF scan of my truck using an FT530 with an 80 dB step attenuator feed by a coax probe with a 1" dia loop on the end. The signal scale on the HT is not calibrated so take my measurements for what they're worth.

1. The 147.40 approx signal is full quieting when probing near just about any wire on the truck anywhere and also on many metal structures.

2. I attenuated the signal by -10dB to get it down to just full scale on the HT. Then I tracked the strongest levels down to the ABS braking unit. Then I attenuated down another 20dB (-30dB total) to keep the level down around the ABS unit.

3. The strongest signals were located near the center of the ABS unit's black sealed cover. Interestingly there is a 1 foot square foil sheet bonded to the underside of the hood directly above the ABS unit (Hmmmm-what system is benefitting from that shielding?)

The strongest signal level I found required -33dB attenuation to get the receiver to become slightly noisy (no longer full quieting) and about -38 to -40 dB to get to the highest noise level, same as removing the antenna altogether produces (with squelch open). In other words it appears that the ABS unit RFI is 40 dB above the noise. This seems like a substantial signal level. In watts, I dont know what that would be.

I may try to shield the ABS unit, but from some postings that doesnt seem too hopeful.

No one written anything about your rig, Jim. I don't even know if
you own the TH-79A that the only rig that this discussion was about.
That set is designed to operate with 12v in ICAS, where it runs hot.

Subject: Mitrek Repeater Conversion Help ////////////////

There are modifications for the Mitrek for repeater use. However, they're
not
recommended for repeater use because the transmitter and receiver sections
are all mixed togther. Micor or GE Master II is a better option.

Subject: NEW ! ICOM IC-746 NEW!

Thanks Michael. I tried to access the referenced web sites but my web
reader would not download the graphics correctly.

Looks like the 706 MK II is still the appropriate choice for a small
mobile unit.

From: ki0dz@juno.COM (Mary-Frances R. Bartels)
Subject: Online Swap Info Requested

Hello,
Please forgive me if this is a bit off topic. It occurred to me a few
days ago that those wanting to buy used ham equipment might have a
difficult time locating online swapfests. I did a few searches and
didn't come up with very many though I know full well that there are a
lot out there.
It also occurred to me that perhaps I could gather a list and turn it
into a "page o' links" for my homepage to benefit anyone visiting it.
So, my request is that if you either run or know of an online swapfest
please send me the URL. I'll check out those I can, based on the number
of responses, and create links to the best 10 or 20 on my homepage.
Sound good?
Thanks.
73,
Mary-Frances

Thanks everyone for the info. I've direct emailed some of you.

I've done a RF scan of my truck using an FT530 with an 80 dB step attenuator feed by a coax probe with a 1" dia loop on the end. The signal scale on the HT is not calibrated so take my measurements for what they're worth.

1. The 147.40 approx signal is full quieting when probing near just about any wire on the truck anywhere and also on many metal structures.

2. I attenuated the signal by -10dB to get it down to just full scale on the HT. Then I tracked the strongest levels down to the ABS braking unit. Then I attenuated down another 20dB (-30dB total) to keep the level down around the ABS unit.

3. The strongest signals were located near the center of the ABS unit's black sealed cover. Interestingly there is a 1 foot square foil sheet bonded to the underside of the hood directly above the ABS unit (Hmmmm-what system is benefitting from that shielding?)

The strongest signal level I found required -33dB attenuation to get the receiver to become slightly noisy (no longer full quieting) and about -38 to -40 dB to get to the highest noise level, same as removing the antenna altogether produces (with squelch open). In other words it appears that the ABS unit RFI is 40 dB above the noise. This seems like a substantial signal level. In watts, I dont know what that would be.

I may try to shield the ABS unit, but from some postings that doesnt seem too hopeful.

I didn't do much searching. The most active Sept. 6-7 were 307.7 and
345.9 Mhz. They delayed the Fleur-des-lis because of a minor radio
glitch. Does anyone know all of the nicknames... Yogi, Scooter, etc?

From: "Dale Wentz"
Subject: Yaesu FT-990 Help Please

I have a FT-990 DC that did not have a 500Hz CW filter in it. I ordered one from AES, and the box says XF-106C, which is the part that I ordered. But the Filter has XF-10.9M-501-01 On it. The XF-10.9M-202-01 is the 2.0 SSB filter. The filter seems to work, but not as well as I think it should. Can anybody confirm that I have the correct or incorrect filter.

Thanks for you help

There are three potential solutions. (1) change the crystal. (2) ground the crystal case to the adjacent coil can with a short piece of wire (works about 50% of the time)--or--(3) reduce the value of the series choke to 10 uH.

The VFO drift could be attributed to a couple of things--depending upon when the radio was built. All of these radios experience some short-term warm-up drift in the first 10-15 minutes of operation. This is due to component heating of the parts in the VFO tank when the radio is energized. After that, some experience long-term thermal drift and others do not--depending what parts are used in the VFO (the newer ones should exhibit little or no significant long-term drift due to ambient temperature change). To answer that question, I would need to know if the VFO coil (L3) is a Coilcraft coil (hex slug, no markings on top) or a Toko coil (slotted slug, lettering on top of can). Also, what kind of capacitors are C32 and C33. Are they polystyrene or multilayer (ie.) round clear plastic or small and blue)?

Finally, check the supply voltage to your AF amplifier chip (pin 6 of U4--LM386). If it is down around 10 Volts, then you have an older radio--and there's a modification that will connect its plus line directly to the 12 volt unregulated line (through R38). This increases the radio's AF output. Also, try jumpering R27--this will increase IF gain.

I presume the radio is out of warrantee, or it would be fully covered in the first year (MFJ's no-matter what warrantee). If you need specific parts to cure these problems, ask customer service to send them to you. If they can't or won't for any reason, contact me by E-mail and I'll see that you get them.

Glad you are having fun with the rig. Hope this helps.

Rick K1BQT

KB8EE's 10 Minute ID'er. A software id'er written for Windows 95/NT only.
This program will not work in Windows 3.1!

The id'er allows you to display text of your choice in a window that also
displays the current time of day in am/pm, gmt, military(24 hr) or zulu.
The window also displays the time remaining until ID time. If the form is
minimized the time remaining is displayed on the task bar.

The current time, and ID times can be announced through your sound card
if you so desire.

You must download the hcsnd95.dll file for the audio portion of the
program to function.

Try it for free.

Try putting a new battery on the board, a bad one can cause some pretty
strange problems. By the way that is the hardest borad in the 6790/gm
to get a part for or a replacement board. Tucker in Dallas might have
some but be ready to open your wallet.

Hi Tony, right on. There were 'am actors long before there were any
amateur radio operators. 'am and amateur share the first syllable.
Seems like a natural progression to me.

For Sale:

Mosley PRO-57B NEW! still in sealed boxes!!

Specs: 24ft boom, 10m/12m/15m/17m/20m 5bands!
92 lbs assembled weight, 7 elements, 5KW,
11 sq ft wind surface area. A BIG beam !

I bought this a few years ago, never got it put
up and now my interest in ham radio isn't
what it used to be....

This is still the current model, that Mosley
gets $747.00 for. You can call Mosely at
1-800-325-4016 and request a free catalog
if you would like to read all the specs.

I want $550. for it, and it is best by far
if you come here to pick it up, as it comes in
3 boxes, total weight is about 110 lbs.

My location is Croswell, MI (about 70 miles north of
detroit, MI Phone 810-679-3535

FT-50 is a nice working radio, but it's like carrying around a brick.
Weighs a ton. Way too thick
to put in a shirt-pocket. Yes, I had one for two weeks.
I sold it and bought the Standard C510A.
Played with a VX-1 for several hours. Would have bought that if it
had worked...way too many bugs and poor design choices in the software.
Locked up the processor on the first thing I tried to do. Next
generation will
be better...
Saw a mini Kenwood at a hamfest. Looked almost exactly like a Standard
C508 in size and function. So, I don't expect anything neat from
Kenwood in the near future.

I guess I'll have to bite on this.... What Bugs???

I have seen a few comments here about the VX-1R being too buggy, but have not seen any specific examples. I have had one for about 3 weeks now and in that time have been using it daily and used every mode/bell & whistle except the Digital Coded Squelch or Auto Range (I do have a friend tho that has two of them and does use both those modes). So far at least, it has worked flawlessly.

I do agree that it would be nice to be able to mix & match frequency's from various bands when scanning, but this is a software design, and I suppose we all will find fault with every radio to some degree.

Anyhow, my vote is Two Thumbs Up for this little guy.

I paid $300 new for mine. The only problem I have had, which is rather
annoying, is that the antenna connection is usually loose. Tightening
only works for a day or so. If anyone else has had this problem and
cured it, I would like to know. Thanks k2gt

5225. Syntor X receive sensitivity improvement 450 - 460

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-10 00:00:00 UTC
From: Gary Sanders <nospam/gsanders@gte.net>
Message-ID: <5v6a8a$mg3$3@gte2.gte.net>
Source record: 166374

Has anybody found a decent way to improve the receive sensitivity of the UHF Syntor X in the 440 - 450 range?

I've tried retuning the front end and injection slugs, and I've installed the factory preamp. The tuning didn't help at all, and it took me forever to get it to some semblance of working at all again! The preamp helped a lot, but the sensitivity is still poor below about 448 mhz.

As it stands right now, the sensitivity is about 100 microvolts or so at 442, and getting better the higher it goes in frequency, until it's about a quarter microvolt at 449 and above. It stays that way all the way up to 470. It's basically unusable through most of the 440 band.

Of course, the repeater I want to use it on is around 442. Go figure.

By the way, I'd like to not necessarily kill the sensitivity at the high end, if possible, just extend the low end. If that's not possible, I'd like to shift the passband down to 442 to 263 mhz.

Anyone have any ideas?

73,
Gary

R-C is a mailing list (reflector) devoted to the
discussion of R-C, radio controlled devices such
as airplanes, helicopters, boats, cars, etc.

As these sometimes use amateur radio frequencies
in the 6m band (50MHz) by those who are properly
licensed to do so, this mailing list is sponsored
by radio amateurs, but NOT limited to discussion
of amateur radio nor to membership by hams only.

Anyone may join.

Amateurs have done many interesting things with
these devices, including live video transmission
and telemetry, etc.

To join the mailing list, send email:

Even better, get that device that looks like a cassette tape with audio input (like the ones that they advertise for cd players to play through your car stereo), also get a mono to stereo adapter from radio shack and plug it in your car stereo. You'll enjoy full, rich, loud sound. Also before you turn the FT8000R on, adjust both volume to low. If you only want to hear VHF just turn the UHF volume to zero or vice versa. Also you will hear both VHF and UHF through your car speakers.
Hope that helped.

5231. SSB vs Landwehr preamplifiers?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-10 00:00:00 UTC
From: Mike Blanchard <n5kdy@amsat.org>
Message-ID: <34175A87.E0FA65D0@amsat.org>
Source record: 166380

Can anyone compare/contrast the SSB and Landwehr 2m and 70cm pre amps
for use with amateur radio satellites (like AO-10)?

A friend of mine has a IC-821H transceiver and KLM satellite antennas
and found that he needed a pre amp to be able to hear the AO-10
satellite. He purchased a used Landwehr and it seems to work ok. Neither

of us were able to find any specs. for the Landwehr (the original owner
of his pre amp lost all the documentation). I need to purchase a pre amp

and am not sure which unit (SSB vs Landwehr) to select?

"Sean and Leigh" <sean.nixon@ibm.net> writes:
>The FT50 on the other hand, can be plugged in to 12V DC straight from a car
>battery with no current limiting as its charging circuitry in the radio
>will limit the charging current.

This is true. The FT-50's internal charger is a constant-current source
with about 60 mA output.

>I think it is quite acceptable to leave
>the FT50 supplied with 12V as the charge current drops to such a low value
>when the unit is charged that it wont overcharge & heat up the battery.

The charger is constant current, so the current does *not* drop when
the battery is fully charged. The rate is quite low, C/10 for even
the smallest battery, so the battery can take charging at this rate
indefinitely without venting. On the other hand, it isn't good to
overcharge a NiCd for days on end - that will eventually cause voltage
depression.

So if you want to supply external power to a FT-50 for days on end, it
would be better to remove the battery. If that's too awkward, install
the FBA-15 alkaline case in place of the NiCd battery. Leave the FBA-15
empty for the lightest possible weight, or install alkalines in it to
provide instant backup power if the 12 V supply fails. (The FT-50
won't attempt to charge the alkaline batteries - the FBA-15 has no
contact to mate with the radio's charger output pin).

Maybe because most of your binary post never made it across many newsfeeds (Mine unfortnately EXCLUDED).

> Anyone interested in trying the program can e-mail me at kb8ee@netexp.net
> and I will gladly e-mail you a copy of the program.

Then this is what you should've said. I don't mind downloading this as I can decode this with my eyes. I don't need the decoder that comes with my newsreader (which is Anawave's Gravity, BTW). But in rereading your original post, not even Gravity's decoder could decode your binary jibberish.

Anyway, I think enough has been said and I consider this a dead issue.

73's for now my friends!!! :-)

There has been so much "Bitching" and other bad vibes on these news groups that I just had to brag about the Hams that I have had the honor to have dealt with.
Here are a few of the guys that have went that extra mile when I requested help.
Mike KF4LUW, Ed W7DXZ, Fred VE3CFZ, and Tom DeFelice who I did not get a call sign from. I know there have been many others, but I did not get the chance to copy their Call Sign. These guys make me proud to be a fellow Ham. Don Smith KB6GQA

After having lived with mine for a while, I can say I think it is a nice
little *amateur radio*. It has out of band receiving capabilities which
can be amusing, and sometimes potentially useful, but it is not equivalent
to a purpose designed scanner in either convienence features or raw
performance. It isn't a Walkman replacement either (no stereo, and
an odd 4-circuit mic/earphone plug you can't find anywhere but from
Yaesu). But it will serve for monitoring National Weather, or for listening
to bulletins on FM broadcast (AM broadcast reception is virtually useless,
however). And of course it isn't Type Accepted for transmission in the
commercial services, so you can't use it for that.

But as an *amateur radio*, it is quite good. It has more memories than
a reasonable person could ever use, CTCSS encode and decode, good
sensitivity in the amateur bands, fairly good IMD performance, and
500 mW is often plenty of power. Audio output is clear, if a little low,
and transmit audio sounds very good. Battery life is good, and recharge
is fairly rapid. And it is so small it could almost serve as a key fob. I call
it a keeper, especially if you use it with your vehicle radio operated as
a cross band repeater.

> 73's NS1R Steven Hershman

Steve, some of the amateur radio manufacturers that advertise in CQ and
QST proclaim "NEW," even when the item has already been out for two
months and is ready to be closed out. So you cannot believe everything
that you read, such as your incessant postings about what is "really"
new.
By the way, are there any cb mods or cordless phone/baby monitor mods
for the "new" IC-746?
Thank you, Brian/N0iMD

As a service to the Usenet community, Richard Depew runs a program
that searches and cancels binaries posted to discussion groups. His
(correct) justification is that binaries don't belong in discussion
groups (that's usually stated in a group's FAQ/charter).

In any regard, thanks for sharing your IDer program with us.

Check Interface A to see it has power, make sure you did not damage
the fiber optic cable during the install. The modulation was
sometimes low, you might need to adjust this. There are two
adjustments, in interface A and in interface B. Try another
interface A and / or B if you can borrow these.

>
>Tom, kv2x

The IC-706 only meets the 0.3 micro volts for 12 db sinad with the
preamp on. When the preamp is off the receive sensitivity is
undefined. You may have blown D6 on the filter unit. I know one who
had a 706 attached to a 2 meter 5/8 wave antenna measured 18 watts
back into the 2 meter front end when transmitting on 6 meters. Make
real sure you have 4 or 5 feet antenna separation, also you might try
a 2 meter antenna that is not resonant on both 2 and 6 meters once you
repair the radio if it is in trouble.

My problem is that I'm wanting to setup a packet station and I can't find any info on connecting the radio to the tnc(mfj).

I visited http://prairie.lakes.com/~medcalf/ztx/wire/y727.html but my radio wasn't listed. It was just for "newwer hts". I have the user's guide but it doesn't say anything about packet connections.

I'm sure someone in this group has came across this setup before. Thanks in advance for any help sent my way.

Dan

I have come into possession of the following items. All
prices include shipping within the U.S. I will be happy
to ship C.O.D unless prepayment is prefered.

Kenwood TS-830S complete with the following items.
VFO-230 external vfo
AT-230 antenna tuner
SM-220 o'scope
SP-230 external speaker
Shure desk mike
All for $1125.00

Kenwood TS-830S with a Shure desk mike. (This is in addition
to the previous TS-830S.)
These two items for $600.00

Kenwood TS-130S complete with the following items. (Sorry, this
one does not have a power supply.)
SP-120 external speaker
VFO-120 external vfo
MC-50 desk mike
All for $500.00

Kenwood TS-711A
This item for $600.00

Kenwood TL-922A w/10 meter modification
This item for $1000.00

Miscellaneous items:

Kenwood SW-2000 watt meter -- $75.00
Kenwood PC-1A phone patch -- $75.00
Drake MN2700 antenna tuner -- $200.00
Drake TV-3300-LP filter -- $40.00
MFJ407C electronic keyer -- $50.00
Bencher BY-3 (gold plated) -- $195.00
Telex HyGain Ham IV rotor -- $200.00 each (I have two of these)
Alliance HD-73 rotor -- $125.00

I own one of the Heathkit Most Accurate Clock II GCW-1001. I am very happy with it and have experienced no problems. I use an inside dipole that is fairly resonant on 10 Mhz. It sets itself at least once a day to hi-spec. I also have 3 of the remote GCW-1001 clocks that are supposed to set themselves via the AC lines as long as they are on the same circuit or phase. I haven't had very good luck with them. I would like to someday locate one of the GCW-1000 at a good price. I put up an information page at my homepage on the GCW-1001 You can check it out at:

http://www.geocities.com/~kc4kin/mac.htm

I also have a page on the Heathkit ID-5001 weather station. It's at:

http://www.geocities.com/~kc4kin/5001.htm

I would like to see a user's support group started for both of these items. I have had to service my weather station numerous times and think a mailing list or perhapsa newsgroup or information board on a webpage would be very helpful. Would be interested in hearing what you think. You can email me at:

kc4kin@geocities.com

Thanks,
Ricky L. Ponder

Do a search for either of the following : SEDAN (SouthEast Digital
Network), or K4ABT. Buck's (K4ABT) site should include the 411e.

While I haven't visited Karl & Gloria's "new" website mentioned above,
it "should" include a Yaesu pinout that would be correct for the 411e.

The MFJ 1270 startup manual's diagram for a Yaesu HT should still be
correct for a FT-411e. Still need a cap and a resistor (somewhere
around a .01 mfd and 2.2K if I remember correctly) Values not critical,
Your Mileage may vary!

WEST TEXAS AMATEUR RADIO CLUB
American Radio Relay League Approved
Fourteenth Annual Odessa Texas Hamfest

November 1st and 2nd, 1997

LOCATION: Ector County Coliseum: Exhibit Building C
42nd St.(Hwy. 191) and Andrews Hwy. (U.S. Hwy. 385) in Odessa, Texas.

There will be over 21,000 square feet of exhibit space. Our talk in
frequency is 145.470 neg. with an 88.5 tone.

Distributors - Dealers - Grand Prizes - Door Prizes

VE Exams on Saturday (1:00 p.m.)

Major Prizes for 1997:
1.Pre-registration prize: IC-2710 DualBand Mobile
2.1st Grand Prize: IC-706MKII HF/6mtr/2mtr
3.2nd Grand Prize:Yaesu VX-1R DualBand H/T
4.3rd Grand Prize: To Be Announced

Lots of Hourly Door Prizes.
(You must be present to win door prizes.)
(You do not need to be present to win the GRAND PRIZES or
Pre-registration prizes)

DEALERS PLANNING TO ATTEND OUR 1997 HAMFEST: (List Current as of 8/8/97)
K-Comm
Rad-Com

Our ham club desperately needs an IF/RF board for a VHF Motorola Micor. We will buy the board or the whole radio as you wish. The part number we need is TLD8272B or possibly TLD8272A. This part number can be located on the back of the IF/RF board (the board with the channel elements). Anyone having such please contact me via e-mail asap at kc7dba@primenet.com. Thanks in advance for any help.

: John in Roseville CA.
: mailto:rtwod2@ns.net
: http://www.ns.net/~rtwod2/
: "Never drive faster than your guardian angel can fly"

A place that sells the test sets can order these for you.
BTW, for thin wire, the little round group of tiny spikes works better
than the one larger spike.
The tiny spike type is called "bed of nails".
If you want to order them directly...the main manufacturer is J.S. Popper.
Note:the rubber boot is often not included, unless you pay extra for them.

5266. fs-ITC 2mtr. ALL-MODE $200-

Source record: 166429

Hi Fellows;
I have an ITC 2mtr. all-mode for SALE:
It was brought in by KLM, 144-148 mhz. 10watts high, 2 watts low, USB, CW, AM, FM.
Synthesized by decade knobs, last + or - 5khz is VXO(variable, fine tune), mike,manual.
Has 136.5 tone for my local repeaters, internally adjustable, built in supply and speaker, will run on 12 vdc if needed. Its a very inexpensive way to try VHF-SSB to see if you're gonna like it then move up.
Exc. condx. PRICE is $200- plus shipping from Long Island, NY.
Thanks es 73.....RICH RLUCCH2098@aol.com

I thought it was NEW because the ad says NEW. If it has been around for
5 years why would the Greek Dealer say "NEW". Why would Kenwood not make
the model for the USA. It seems Kenwood has no entry level HF radio
like the Yaesu FT-600 or ICOM 707 in the USA. I guess the TS-50 is sort
of. Go to http://www.drele.com and see it says "NEW" just like the
ICOM 746.

> 73 Jerry KK5YY

I saw two posts from guys who had the radio moded at the DEALERS in ten minutes. The first guy had the Dealer take the radio into the back room and did the mod at time of purchase. The second case was a guy who brought the radio
back to the Dealer because he didn't have his "MARS/CAP" Permit with him at time of purchase. When he brought the radio back the Dealer took the radio into the back and returned in ten minutes also. The second guy checked the inside of his radio BEFORE and AFTER the mode. He says a "TRACE" was cut on the PCB board. I have asked him repeatedly to post the mod he believes did it even if he is not sure so the "TECH TYPES" can verify the mod. His E-Mail address from the post just bounces my message back to me. I told JERRY KK5YY that I will stop posting stuff to the "EQUIPMENT NEWSGROUP" if I am wrong about this mod. I can't believe that the dealer changed the EPROM in 10 minutes unless it was a socketed EPROM. I still think it is more simple than that.

From: tnic@IDT.NET
Message-ID: <5v63b3$j1t@nnrp1.farm.idt.net>
Source record: 166434

Why not use the FT-50R with the small battery?
Its only slightly larger. You will get 2.5 watts rather than .5 watts.
You can use the larger battery pack for 5 watts.
Nima batteries provide excellent bat life.

The audio is far better and you will need good audio if you are outside.

Its dual band and the mod is so easy a kid could do it.

It comes with a key pad for autopatch (no keypad for vx1-r).

The VX1 can not provide much power output and the speaker is lacking for
outdoor use.

The FT-50R (current most popular selling hand held) can provide up to 5
watts and good audio. For smaller package use a Nima small batter.
Its pretty small (not as small as the VX but provides more power). If you
only need low power adjust the FT-50 power output down to .1 watt and
enjoy better battery life.

Bob <bob@huskers.com> wrote:
: I am considering purchasing a Yaesu VX-1R. I just purchased an Icom
: IC-W32A, which replaced an Icom IC-T7a that did not work correctly even
: after two units, and decided the W32 is too big and heavy. I want a
: small and light dual band ht and the VX-1R appears to fit the
: requirement. The Yaesu FT-50 is also too heavy. I currently have an
: Icom IC-P4AT and it is about the right size and weight, but only a
: single band HT.

: My question is: I have seen a couple of articles that weren't very good
: about the new rig on this newsgroup and wanted to get a few more
: opinions. My requirements are: To use it for VHF and UHF ham, and to
: use it for out of band on UHF as I have commercial repeaters I want to
: monitor and occasionally talk on too, to maybe listen to a commercial FM
: radio station (wide FM feature). I take long walks, and need it to be
: as light weight as a dual bander can be. Living in Lincoln Nebraska not
: a whole lot of power is needed to get to the local repeaters, so the low
: power out does not seem to matter.

: So thank you in advance for your comments.

> See it at http://www.drele.com

I recently got some information about the IC-746 from ICOM AMERICA :

Your messege has been forwarded to us , Icom America to provide

available information to you.

Basic specification of IC-746 would be :

HF,6M and 2M with 100W out put power
DSP Noise reduction for HF to 2m.
Spectrum scope function

RX Freq. Coverage :from 0.5-29.999,50-54Mhz and 144-148Mhz
TX Freq. Coverage :Amateur band only on 1.8-29.7000Mhz,50-52Mhz and
144-148Mhz

TX Out put power
HF/50MHz USB,LSB,CW,RTTY,FM : 100W-5W
AM : 40W-2W

144Mhz band
USB,LSB,CW,RTTY,FM :100W - 5W
AM : 40W- 2W

RX SSB , CW,RTTY(10db S/N)
1.8-29.99MHz 0.16uV at preamp1-on
50-54MHz 0.13uV at preamp2-on
144-148MHz 0.11uV at preamp -on

Sensitivity
AM(10db S.N)
0.5-1.79999Mhz 13uV at preamp-off
1.8-29.99Mhz 2uV at preamp1-on
50-54Mhz 1uV at preamp2-on
144-148MHz 1uV at preamp -on

FM(12db SINAD)
28-29.99MHz 0.5uV at preamp1-on
50-54MHz 0.25uV at preamp2-on
144-148MHz 0.18uV at preamp -on

Audio out put : 2.0W at 8 ohm load with 10% distortion
Rit variable range + - 9.99KHz

OPTIONAL ACCESSARIES
HM-36(Hand Microphone)
SM-20 (Desk top microphone)
SM-8 (Desk top microphone)
CR282 (Crystal filter)
CT-17 (CI-V Level converter)
FL-53A (455KHz CW Narrow Fiter)
FL-52A (455KHz CW Narrow Fiter)
FL-222 (455KHz SSB narrow filter)
FL-101 (9MHz band CW narow filter)
FL-232 (9MHz band RTTY/CW Narrow filter)
FL-100 (9MHz band RTTYCW Narrow filter)
FL-223 (9MHz band SSB narrow filter)

FL-103 (9MHz band SSB wide filter)
PS-85 (DC Power supply 13.8V 20A)
SP-21 (External speaker)
UT-102 (VOice sysnthesizer unit)

All of the above are existing aceoosries for current HF radios.

In addition to that we will have ;
IC-PW1 (1KW liner amplifier)
FL-96 (455KHz SSB Wide filter)

Price and availability : T.B.A.

These are the best information we can provide right now and please note
that even the abave is subject to be changed.

I hope that the information 'abave' will help.

Sean,

Do you think that the battery, which has a charge controller build in, does not regulate the charge current? I wanted to construct my own external 6V DC source for powering the radio, and I was not going to impose current limiting.

Thank you
Tom.

5279. Kenwood 241A battery

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-10 00:00:00 UTC

Message-ID: <5v6fvmkul1@mercury.wright.edu>
Source record: 166442

The lithium backup battery on my Kenwood 241A went out
about a week after the one year warranty. Now it's
gone out again after four months. Anyone have any
suggestions or have a similiar problem?

The term "ham" was in use long before the creation of the FCC in 1934,
or the displacement of amateurs to the short waves.

If we understood and accepted the fact that the "U.S.A." and "America" companies only service the U.S. and only sell radios that are FCC Type Accepted in the U.S. I don't believe they are affiliated with or have anything to do with the companies overseas other than to appropriate merchandise from their respective manufacturers.

Sure you can purchase a radio that has a European style AC plug on it and you can get an adapter or change the plug for use in the U.S. but the radio still would not be made for legal use in the U.S.

Right hand drive vehicles are not manufactured for specific use in the U.S. (although I believe they are legal to drive over here) which is a lot different than the radio issue but the principal is the same. Also, the car may have the same name such as Ford, etc. but that doesn't mean it is made for use here.

You are right. The face is too shiny.
Dare I say its a glaring error on Kenwoods part.
They must not have much sun in Japan or they designed and tested it
indoors.

I am using the remote head kit. If you tilt the had a little its less
reflective. I also put the head in a less sunny spot in the car.

It helped but its not a total cure for all conditions.

Its pretty good radio.

Er, ah, the pseudo-CW as written makes no gramatical sense.
Lets try RIG HR IS HAM or RIG HR DE HAM. The latter
makes the most sense, IE it says the rig is *from* Home Amateur
Mechanic magazine, but the former may have been the one used.
Apparently, no one alive today knows.

Mary-Frances listed this a few weeks ago, and I thought I would share this. I just returned from a week long vacation to Florida, where one of the atractions that I visited at Universal Studios, was Jurasic Park, and Lost World display that you can walk through and see hundreds of movie props; and sure enough, there was a Yaesu FT990 sitting there, with green muck all over it. There was also a Kenwood TS940S, that must have been used in one of the movies too.

5288. Product Annoucement

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-10 00:00:00 UTC
From: bf@sparksintl.com
Message-ID: <5v6o5v$cto@bilbo.w-link.net>
Source record: 166451

For complete information, visit: http//www.sparksintl.com

If you had told me a year ago that I would
be marketing a product that claims it will
remove two inches of fat in 24 hours,
I would have laughed.

"It sounds like snake oil," I would have told
you. "I wouldn't be involved with anything
that ridiculous."

...So much for predicting the future.

HERE'S WHAT CHANGED MY MIND:

Last December, I pushed my doubts aside
and tested the gel on my own "fat-prone
areas" -- stomach, hips, and thighs.
What happened just 24 hours later turned
me, an avowed skeptic, into a wide-eyed
believer. I lost 2-1/2" from my waist,
2-1/2" from my hips, and 3-1/2" from each
thigh -- overnight. I couldn't argue with
my tape measure or the way my painfully
tight jeans were suddenly comfortable.
My husband lost two inches from his worst
area -- his stomach. My mother-in-law
lost 1-1/2" from her stomach, and her problem
was a little bit of flabby skin, not serious
excess fat.

Now my company is marketing this miraculous
product around the world. And we're looking
for serious, motivated people who would enjoy
making terrific money while they sell a reliable
product that delivers results.

HOW OUR PRODUCT COMPARES TO OTHER PRODUCTS ON
THE MARKET...

1. It removes excess fat immediately, within
24 hours. You don't have to wait weeks or months
for it to work as you do with some "body contouring"
products on the market.

2. It liquefies fat naturally with common, European
herbs that have been used safely for centuries; the

fat is then eliminated by the body naturally thru
urination.

3. It's 100% safe, 100% herbal,
100% hypo-allergenic.

4. Quick and easy to use, it takes less than
an hour to apply.

5. No side effects, no after-effects, no strange
sensations - just great results!

6. It can be used repeatedly to lose multiple
inches and maintain the fat loss over months,
even years.

7. Affordable even for people on a budget.

5296. Question on Yaesu FL2100B

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-10 00:00:00 UTC
From: George Edwards <gedwards@onramp.net>
Message-ID: <01bcbd7f$37b5f860$23e532ce@708714231>
Source record: 166501

I recently bought a Yaesu FL2100B amplifier. It is working well for me and I am getting good signal reports. I am connecting it to a 115v/20a power source. Idle Plate voltage is 2400 volts. I am tuning it up and running it in the CW mode. I am driving it with a Drake TR-7 to a Cushcraft multi-band vertical with a SWR of 1:1 on 20meters.

The book says to move the exciter output up and the plate load up as you dip the plate current until you reach maximum output at 0.5amps plate current. Key down plate voltage is 2000 volts. .5 x 2000 = 1000 watts input.

The maximum effective load I can reach is .3amps plate current with 50watts coming in from the exciter. Adding excitation and/or increased load after .3amps does not increase the ouput.

I am getting 400 watts out....and with .3 x 2000 = 600watts in....that's pretty good to me. My confusion relates to the manual stating that the plate input is 1200 watts PEP, 1000watts CW and 600watts AM with a drive requirement of 100wattsPEP.

Some folks tell me that I should be able to get more out. I am happy with the way it works now...but am naturally curious to know if there may be a problem or not.

Hopefully some of you good folks have had personal experience with one of these old guys and can give me some feedback.

Thanks for listening,

George/KD5CBC

I have one Collins 51S-1F round Emblem Receiver in very nice condition
for sale.

Does not have a cabinet; it's set up for 19" rack mounting.

Includes book.

$1,000; negotiable

Thanks for reading this.

5304. Computer Stuff Grab Bag!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-11 00:00:00 UTC
From: Larry Chapman <lechap@bright.net>
Message-ID: <01bcbe9f$1d4a0900$0a7fd4cd@lechap.brutus.bright.net>
Source record: 166260

I have a bunch of misc. computer parts in UNKNOWN CONDITION. Roughly the package contains the following:

A. Dozen, or so, 486 motherboards, several with cpus.
B. Several cd-rom drives
C. Several sound cards
D. Several video cards
E. Several i/o controller cards
F. Couple of floppy drives
G. A dozen or more ide hard drives
H. Sundry other stuff

This is all stuff that came out of repairs & upgrades. I acquire it at such a rate that I have no time to evaluate or test it. I want $200.00 for the entire mess and I'll pay the shipping to the lower 48. I'm sure that if you have the time to test these parts you'll get your money back several times over. Please reply via email. Thanks.

You know, I dont want to sound rude ... but, do schools teach anyone
how to do math anymore ? Even without a calculator?

3.5 mm and 1/8 inch are not equal, at least when i worked it out.
That's right, I got out a pencil and paper.

Sad Day.

The three standard sizes of jack plug connector used on ham radio
gear are 2.5mm, 3.5mm and 1/4" and these are also called subminiature,
miniature and standard or full size respectively. I've never heard of
one being called 1/8" before, but I'm sure that it would be the 3.5mm
or miniature size as that is by far the closest to 1/8"

I've never come across the 2.5mm jack plug connector in ham gear
except on HT's where it is used for the speaker output. By using
that smaller size the dual plug, molded with the mike/PTT plug which
is a stereo 3.5mm plug, is polarized and non-reversible. The full
size 1/8" size is common for headphones and morse keys on base rigs.

I took apart the gizmo the Yaesu sells that allows you to use a "normal"
two prong hand held mike on te radio. Its sort of splits the FT-50
connection into two traditional connections for ear phone and mike.

It costs about $10 but it worked for connecting the TNC. Yaesu also sells
a Y wire for TNC use on the FT-50.

I just measured a "1/8 inch" connector. It is exactly 3.5 mm in
diameter which is a tiny bit larger than 1/8 inch. It is apparent to me
that the "1/8 inch" designation is just for the benefit of metrically
challenged North Americans.

Use it without fear.

I notice when I reformat paragraphs with ^J in PINE, it eats the second
space that I automatically type after the end of each sentance. Wonder
whether this is a reflection of the "net convention" you refer to or was
(one of) the cause(s) of it?

Hi Russell,

The 1/8" and 3.5 mm connectors are not *exactly* the same size, but
they're so close it makes no difference. They are interchangeable.

I've been using the cheap Radio Shack CB extension speakers at home
and in the car for YEARS, and they work great. Never had problems
with them, and never had one go bad. The one in my truck right now
is about 15 years old and still going strong in daily use. Truck
sits out in the weather all the time too (no garage space for the
pickup because I keep my two classic Mustangs in there). Go ahead
and grab the R/S speakers and enjoy the money you save!

I HAVE HAD THE MOSLEY PRO-57B ANTENNA SINCE JUNE OF 1991. IT IS ONE OF
THE FIRST ONES TO REPLACE THE PRO-57A. I HAVE BEEN VERY WELL PLEASED
WITH THE ANTENNA.
THE QUALITY OF THE COMPONENTS IS EXCELLENT. THE ONLY PROBLEM THAT I HAD
WAS
THE MAIN BOOM SAGGING DUE TO A HEAVY ICE LOAD LAST WINTER. I FEEL THAT A

SUPPORT KIT FROM THE MIDDLE OF THE ANTENNA TO EACH END WOULD BE A MUCH
NEEDED IMPROVEMENT IF YOU ARE IN AN AREA WHERE SNOW AND ICE ARE A
PROBLEM.
MOSLEY MAY HAVE MODIFIED THIS BY NOW BUT I AM NOT SURE . THIER CUSTOMER
SERVICE IS EXCELLENT !!!!! WHAT MORE CAN I SAY ?? GIVE THEM A CALL.

It is more universal than that. "Ham actor" referred to an amateur
actor and carried over into radio.

Try a hair dryer or somesuch heated air blower to soften the glue on the mounting pad then take a thin scraper or blade to slip under the metal housing to cut the pad loose and clean the mess that still sticks. Extra mounting pads can be obtained from Larsen to reinstall on another vehicle.

>So the question is has anyone been able to source the plug...if not what
>have
>been the alternatives. Any help would be greatly appreciated.

One of the alternatives is to buy the Yaesu adapter. They sell a device
that hugs the right-hand side of the radio, plugging into the speaker/mike
jack and hooking over the base of the antenna. It provides the standard
separate 3.5 mm speaker jack and 2.5 mm mike jack at the standard spacing
facing upwards just beside the antenna. From there, you can connect
an external speaker or a TNC with its standard plugs. In addition,
the lead used for programming or cloning the radio is brought out to
the jacks, so you can do that via them too.

The only problems with it are:

- plugging in the adapter disconnects the internal speaker, so
you *have* to use an external speaker or a speaker mike. It is
not possible to use an external mike alone and still hear audio

- the programming connection is the ring terminal of the 2.5mm
mike jack, not the ring of the 3.5 mm phone jack. So you can't
use the same cable for programming/cloning the FT-50 that
you would use for the FT-51.

Yaesu also sells a cloning cable for the FT-50 with two of those 4-wire
plugs on it. However, I don't know if the cable connecting them is 4-wire
(in which case you could buy the cable and cut it in half) or 2-wire
(which isn't useful for anything but cloning).

Actually, only a minority of Americans (about 1/3) care anything about baseball. American football is another matter!

It's not only American programmers, but Americans in general who have a poor grasp of English. A good (extremely poor?) example of this is the recent USB (Universal Serial Bus) specification. This document, which one would presume was written by someone of intelligence, is a horror to try to read for comprehension. It appears to have been written as a "stream of conciousness" with no concern for structure, intelligibility, or anything else. Since it was supposedly produced by a committee, one wonders about the collective wisdom and the lack of technical editing.

There's also been a recent thread in another newsgroup wherein one individual has been trying to present a case for a concept. His presentation is so poorly done that nobody can understand whether or not his concept has any merit. Somewhere amid all the words there may be a real nugget of gold, but nobody can find it.

Hi Ray, here's a quote from the "Word For Word" newspaper column:
"An earlier 'Word For Word' suggested that the term 'Ham Actor'
probably referred to the ham fat once used to remove make-up.
On the other hand, a 'Ham Radio Operator' is certainly a play
on the word 'amateur'. The term was coined in the 1920s."

The fastest way is to use a single-edge razor and a flat piece of plastic
to
push it with. Carefully cut through the adhesive around the edges as much
as possible. Next use the plastic to push the blade further under the
mount
trying to cut an even amount towards the opposite side. By the time the
razor is about half-way through the mount should begin to give by pulling
evenly while continuing to cut. Before the razor reaches the opposite side
the mount should pull away from the window. Use lots of patience -- The
best razor to use is a new one and they are SHARP!

Mike:

For about $30 more, you can buy a brand new Icom W32A, which is basically the same radio as the Z1A, but the speaker is not detachable. However, the audio on the W32A is better and I think the keyboard is a little more user friendly.

From: titanic@gate.net
Message-ID: <34185f4c.1892215@news.gate.net>
Source record: 166308

I have a Packet Radio Problem, and I hope someone can help me solve
it.
First of all, the equipment:
Kenwood All-Mode 2 Mtr Transceiver
PK 232 MBX TNC
Cushcraft 13 element Yagi up 50 feet
Packrat ll computer software for dos
Now the problem:
I have no problem RECEIVING packet data, but I cannot CONNECT to any
Packet Bulletin Boards or other Packet Stations. I have the threshold
on the TNC adjusted correctly so the DCD flickers appropriately, and
when I try to connect to a station, the Send Light does go on, and the
Transmit Light on the radio does come on as it should. So the TNC
appears to be "talking" to the radio as it should. The antenna is
pointed directly at the local BB Station abt 5 miles away. The radio
is set to Simplex as it should, and the radio power is set to high.
Any ideas? I certainly would appreciate any suggestions,
Tnx, Doug

Well I guess that you will have to move to the UK where the standards are a bit higher. It is ashame that all the " other" places in the world do so much better than the USA . I wonder why every time they are in a jam the " poor uneducated americans bail their ass out " this includes the second world war on up.....and the crying still goes on.....all I hear about is how stupid and under educated americans are..... YOU would have us beleive that a degree and the use of proper spelling is the last word..... Most of the people that make america work cant spell very well, write letters with proper grammer , or use math beyond basic addition..... The biggest pricks I ever knew were the overeducated KNOWITALLS that couldn"t change a spare tire to save their ass. Dave Schneider

Another thing to check is the modulation level -- being over-modulated
is a killer problem on packet, if in doubt reduce the audio drive level
until you know the outgoing signal is slightly UNDERmodulated.

5357. LAN Noise

Newsgroup: rec.radio.amateur.equipment

If you go to the ICOM Japan Web Site the IC-746 lists for 198,000 YEN
and the ICOM 756 goes for 256,000 YEN
The Yaesu FT-920 lists for 198,900 YEN and COSTS $1700 US dollars so
I figure the IC-746 will costs the same after the initial offering.
Remember, the ICOm 756 stated out at $2300 USA Dollars ut Now is as low
as $1910. Wait six months and the price always drops.

MIDLAND TRANSCIEVERS FOR SALE

I have 2 Midland Syntech mobiles. A 70-066 70mhz
50 watt link radio. Also a 70-052 85 watt low
band. The radios are not in a link configuration.
The 70mhz is coupled to the 47mhz so that they it
transmits via a local 70mhz radio. These units
were on a mountain top and used as a remote base.
Both units are very clean. They were used in an
enclosure, so have no scratches/marks. They are
with an Astron 35A supply and an interface for the
linking controls. If interested, contact me by
email. Have a great day!

>well, the input side of the supplied charger is only differnt. output
>side is same in the us or in 240v land....

Yeah, i'm aware of that! however I had to determine how to charge my vx1r in NZ. My intention was to say that it would be unwise to run the unit from a straight 6V power supply, as the charging current can be excessive.

The FT50 on the other hand, can be plugged in to 12V DC straight from a car battery with no current limiting as its charging circuitry in the radio will limit the charging current. I think it is quite acceptable to leave the FT50 supplied with 12V as the charge current drops to such a low value when the unit is charged that it wont overcharge & heat up the battery.

>DC source for powering the radio, and I was not going to impose current
>limiting.
>
Hi Tom

I'm no expert- but from what I have observed, the radio limits the 'total' charge of the battery by turning the charge current on, and off. As the battery gets towards full charge, its off for a longer period of time with an occasional charge pulse.

The problem is with an external supply, there seems to be no limiting of the pulsed charge current to the battery. When the battery is flat, there is not much pulsing, and the charge current is virtualy continuous.
The charger supplied with the radio says it is 500ma, i don't know if this is limited by circuitry or by the size of the transformer.

I used a variable regulated supply and had a play and found that when the battery was near flat with a supply of less than 5V the radio would draw an amp, this is when i chickened out and reduced the voltage.

I you are going to built a power supply, definitely put some current limiting in it. I would suggest that you build it to supply 6 volts with the current limited at 500mA.

Cheers
Sean

I have a Yaesu FT-8100R and am wanting to use two external speakers. The documentation says that the speaker jacks are 3.5mm. Is this the same as a 1/8 inch jack (the same type as one would find on a walkman radio). I don't have the money for a yaesu external speaker so I was going to use two radio shack external speakers but they use the 1/8 inch plug. Will this work? Will it sound OK? Has anyone done this?
Any advice is MOST appreciated!!!

5377. Re: Kenwood TM-V7 face too shiny

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-11 00:00:00 UTC
From: tnic@IDT.NET
Message-ID: <5v7ifb$a56@nnrp1.farm.idt.net>
Source record: 166403

Kenwood says the new TMV-7s have a better face plate than the originals.

If you return your head (the radio head that is) they will replace it
withe the improved version.

The new face is very slightly "masked" or frosted/textured. They say this
minimizes reflections. The new face is not tinted.

They say your satisfaction will vary with your conditions.

I have not returned mine yet. They say it takes about 6 days for the
rapair (after they get it) to fix it and put it back in the mail to you.

While talking to the helpful person on the phone he mentioned that there
is a tech note not documented in the manual on how to put the radio into
remote cross band repeat with a hand held.

You have to ftp to ftp.kenwood.net and cd to Amature then one of the sub
dirs. Look for the tech note aan0020a.jpg and aan0020b.jpg. It explains
the process and key commands.

Once you have the "hot mike" mod to prevent the radio from reacting to
ambiant sounds you will need these instructions to control the radio
remotely. It looks like you can do most major functions with the keypad of
a hand held remotely.

This is good news to me. I have 2 of the TMV-7As. I previously owned a 733
Kenwood. The V-7A is a big improvement and these fixes take care of the
problems I was concerned with. Its a pain to send stuff back but at least
they back the product.

Dave Martindale wrote in article <5v9fi4$k8r@harp.cs.ubc.ca>...

...
>Yaesu also sells a cloning cable for the FT-50 with two of those 4-wire
>plugs on it. However, I don't know if the cable connecting them is 4-wire
>(in which case you could buy the cable and cut it in half) or 2-wire
>(which isn't useful for anything but cloning).

It's a 4-wire cable, wired straight through (no crossings or anything).

There is a version of RTV made specifically for electronic/electrical circuit use. I think (probably wrong here) the stuff is RTV-738. It is a white, relatively oderless goo, that does _NOT_ contain corrosive substances. I also think this stuff, like most RTV's remains pliable, and you may be better off looking for real, 2-part, epoxy of the 5 minute setting varity. Should be able to find it at most any hardware store.

First I used the genuine adapter plug but the connection to the antenna is
a litle bit stiff. I am afraid it could break sooner or later...
A big disadvantage is that you can't use the adapter and the rubber
holster that Yaesu sells for the FT50 together. So I bought the cloning
cable, cut it in the half and built my own adapter. It works fine!

Hello, I have an old Azden PCS-3000. The microphone on the unit has been destroyed (the mic coil-cord and end connector are good) and I would like to retrofit another mic to the unit. The original mic had the following features: PTT, M1 call, volume control, key lock, and freq. up/down buttons. I would like to install a generic mic with touch-tone pad. Does anyone have any recommendations?

Also, does anyone know where I might find a new mic connector for the rig so that I can simply attach it to the new mic without having to splice into the old cable?

From: rfasi@castles.com
Message-ID: <3419c718.697865@snews.zippo.com>
Source record: 166227

This is a NEW Motorola Model GTX 900 MHZ - has 15 LTR Systems and supports 10 conventional channels. Radio uses GP300 frame batteries and accessories. Radio has full keypad and alpha numeric display. Still has 11 months left on warranty - comes with belt clip, battery, antenna and overnight drop in charger first $500 takes the radio!

Dick KM6PA

PS. Don't ask me for the software. I don't think it will go to 900 MHZ in the Ham Bands.

> Most of the time spent at a university is spent learning useless crap.

Well, in the sense that much of what you learn will be useless to you later in your professional career, you're absolutely right.

However, the really important thing that's going on during that time you spend at a university is that you are learning how to learn, and how to think, and how to express those thoughts to others in a coherent manner.

(There are, of course, degree programs in which this does not occur. The phrase most applicable to those is, "Would you like fries with that?")

Bob Myers | "The difference between science and the fuzzy subjects
myers@fc.hp.com | is that science requires reasoning, while those other

Yeah, tell us American types too.

You may think all that info is useless, but try figuring out an advanced calculus formula without all that prior knowlege. It won't happen. They guys that make to computer modeling software (like NEC et al) need to know that math just to get the program to do all the right things when information is plugged in. Do you think these programs just grow on trees????

You need math to build antennas, make resonant circuits that work at high effeciency, etc. Without math, we'd still be messing with bearskins and stone knives.

5410. ICOM IC-746 Question ?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-12 00:00:00 UTC
From: hershman <hershman@ix.netcom.com>
Message-ID: <3419FF34.5AB6@ix.netcom.com>
Source record: 166236

Anyone out here know if the Ic-746 will take more than one optional filter per IF ?
The IC-756 would only allow one optional filter per IF thus you had to decide if you wanted the narrow SSB filter or the CW narrow filter.
Also I am interested in the bandwith of the AM filter. On the IC-756 it is 15 khz wide (TOO WIDE). did they correct this or allow you to replace the filter with a better one?

Thanks in advance, NS1R Steven Hershman

"Ham actor" doesn't necessarily, or even ordinarily, mean *amateur* actor.
It is more generally applied to actors who overact and chew on the scenery
or otherwise attempt to puff their part and grab the limelight from the other
actors. This is called "hamming it up" in the business, and there are a number
of notorious ham actors in the professional acting ranks.

There *is* a certain tendency among amateur radio operators to puff up
their part, IE their self-importance, so there may be the seed of truth here.
It seems unlikely that radio amateurs would want to label themselves in such
a way, but stranger things have happened.

Source record: 166242

Hi Marty
If you could find a Kenwood TS-830S like the one I just
sold, it would be a very good rig. Only handicap is that it has 3 tubes in
the final. Otherwise, it is a much better rig than the 430. By the way, I
sold it for $450. so that's in your ballpark.
73 Michel Morin.

Gary, if you have the 450-470 band split radio it will tune 440
with no problem. You may have tho 470-480 range unit. In this case your
helical resonators in the front end and l.o. chain are too short to
tune to 440. If this is the case I would look for a new radio.

From: rfasi@castles.com
Message-ID: <34188f57.213573@snews.zippo.com>
Source record: 166329

This is a NEW Motorola Model GTX 900 MHZ - has 15 LTR Systems and supports 10 conventional channels. Radio uses GP300 frame batteries and accessories. Radio has full keypad and alpha numeric display. Still has 11 months left on warranty - comes with belt clip, battery, antenna and overnight drop in charger first $500 takes the radio!

Dick KM6PA

PS. Don't ask me for the software. I don't think it will go to 900 MHZ in the Ham Bands.

5424. Recommended First HF Rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-12 00:00:00 UTC
From: martyt@pobox.com
Message-ID: <34189d7c.213324@nntp.a001.sprintmail.com>
Source record: 166330

I'm about ready to get my HF ticket and am starting to look around for a good rig. There's a hamfest coming up in my area in about a month and I plan to see what I can find there, but I need some advice first.

What would be a good, older, all purpose rig for covering 160-10m?

I've got around $450 to spend so can't go for anything too new or fancy. I'm currently borrowing a Yeasu FT-101E from a friend to listen to the code but he's not sure if he'll sell it to me, plus I'm not sure I want a tube type rig. It seems to be a good rig and has over 200W of power, but seems like it's a bit difficult to get dialed in.

What I'm looking for is:
* At least 100W power
* Coverage of 160-10m, WARC is nice but not a requirement
* Reliable
* Easy to configure and use (maybe this means no tubes?)
* Good for phone use (I don't plan to do much CW)
* In my price range (certainly not over $500)

Advice on specific models to look for at the hamfest would be appreciated; please send your responses by e-mail at the address below. (Please don't try to sell me your old rig; I'm not interested in purchasing over the Internet. ;-)

73,

-Marty KC0AKA

5426. Yaesu FT-900 Memory Problems ? ! ? ! ?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-12 00:00:00 UTC
From: Peter and Colleen McGreevy <PMCGREEV@MAIL.IDT.NET>
Message-ID: <3418EC90.7DDA@MAIL.IDT.NET>
Source record: 166332

Greetings,

I have an FT-900, and here's the problem...

With the "quick access" band buttons on the lower left (1.8-29.0 and Gen)... In my past 10 months of using this rig, EACH of those individual buttons seems to be coordinated with a VFO, either A or B. What I mean to say is that If I am on VFO-A, I can have one complete set of "quick access" frequencies "programmed" into those buttons (the last frequency I was on on each band, for each of the buttons), and then on the other VFO I could have a complete other set of frequencies (the last frequency I was on for each of those buttons).

Well, today the whole picture has changed (or I am going nuts) (too much RF)

Now, If I am, say, on VFO A, and I hit 1.8, and the 1.8 is set to 1900Kc, then I hit the 28 button, which is set to say 28.450... now, I hit A/B and to go to VFO B (which is set to 28.300 while in the 28.0 range) and (here comes the problem) when I hit 1.8, the radio SHOULD go to (for example) the last frequency I was on when I was set on VFO B while I was in the 1.8 range (which, for this example is, say 1.850Kc.) Now, instead of going back to 1.850, it returns to 1.900... which is the last place I was on while I was set to VFO-A, but NOT the last place I was on while set to VFO-B (which was 1.850)....

WHAT IS GOING ON?!?!?

Please reply directly to my email, thanks,

Pete

Any radio currently being sold in retail stores (such as the SC150
Sportcat) can NOT be modified. (in a simple manner as older units can)

5437. Gonset VFO Help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-12 00:00:00 UTC
From: Dale Wentz <dwentz@accessus.net>
Message-ID: <01bcbf64$e0209dc0$a32404d0@dragon.mcs.accessus.net>
Source record: 166343
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

At a recent ham fest I picked up a Gonset FVO in hopes that it would work with my Communicator II 2 Meter rig.

The VFO has settings for 6 Meters, 2 Meters, and 220 Mhz. It has 3 RCA jacks on the back , and a cable with a standard x-tal holder atached. I fired up the VFO and the rig, and pluged the x-tal into one of the sockets, but get nothing. I checked the freq at the x-tal holder pins of the VFO with a counter, and get 24-25 Mhz depending on where the band switch is. The rig uses 8 Mhz x-tals, so this will not work. The rig does have a VFO jack in the back, but I dont know what the input to this should be, and also dont know what the 3 rca jacks are for on the VFO. I don't have books on any of this stuff.

Can anyone can tell me if this VFO will work with this radio, and how to hook it up?

Thanks very much, 73's de KB9JJA/Dale

Thank you, Tony, for so appropriately responding to Brian's post. By my count, Russell's valid question got three useful and informative answers and one rude and hurtful response. Your comment on the one made me laugh.

I've got a question, though....you say the 2.5mm plug is used on HTs for speaker output, while the 3.5mm plug is used for mike/PTT. I don't have my HT here in front of me, and as I am prone to the occasional brain drain I may be remembering wrong, but I think the 3.5mm is the speaker output and the 2.5mm is mike/PTT. Lemme know if I'm wrong (I'm sure someone will be glad to do that). ;-)

5440. Yaesu VX-1R Hints

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-12 00:00:00 UTC
From: pasek001@maroon.tc.umn.edu
Message-ID: <42399.pasek001@maroon.tc.umn.edu>
Source record: 166346

When I bought my VX-1R I didn't buy the optional carrying case figuring I'd try a few other ideas first, here are some of them.

First I found a soft eye glass case. You know the kind that sits in your shirt pocket or on you belt vertically via a belt clip. I used a thin piece of tubing with the end filed sharp as a hole punch and put 16 holes in a square shape near the bottom so I could still hear it. This worked great as a sort of holster for the radio and gave it a "Stealthy" look but did pop off my belt a few times when I sat down :-(

Next, a buddy of mine found a hard leather cigarette case for $6 for his VX-1R. It's a tad on the roomy side, but solid belt strap guaranteed not to come off.

Finally, I was at one of the local malls and ran across a soft leather case for the small Sony cell phone. Almost a perfect fit, real snug belt clip, and after I cut holes in it like I did with the glass case, I can operate the radio with the case on or use it as a holster and remove it for operation.

Also, I wanted to be able to wear the radio like a speaker mike on my shirt collar when at a hamfest or in a noisy environment but didn't trust the belt clip that came with the radio (too expensive to drop). One day at work I noticed one of my very large co-workers holding up a equally very large pair of pants with suspenders that had very tiny clips. I figured if those clips were good enough to hold up all that mass, one should hold up my radio, so off the the fabric store my wife went. For $3 she bought a pack of two clips, I took one apart and drilled a hole in it's base found a short screw (the existing one was too long), and as they say, "The rest is history". Good solid bite on the collar and shouldn't come off unless the screw comes loose.

The next thing I'm going to try is make a dummy load out of a SMA connector and a 50 ohm resistor. I figure when using the radio at a hamfest or where the other person is just across the room, the 200 mw pwr setting into a 1/2 high SMA dummy load will work just fine, and no antenna to pick up interference. Maybe taking this one step further one could put this radio on a wrist strap and go Dick Tracy style..... but that's another story. :-)

Hope some of these ideas might help or at least get others thinking of things.

Hi Marty....

I would recommend the kenwood TS430, it is a solid state, good
all around radio and has general coverage if you are interested in SWL. It
may or may not have an FM board installed you can check with the owner on
that...

You can pick one up for around $350--$400

It is an excellent first radio.....

Hope that helps

73....Jim

5443. TS-830 Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-12 00:00:00 UTC
From: Jack <ka2ivs@idt.net>
Message-ID: <34193A53.49F1@idt.net>
Source record: 166349

I'm having trouble with my old, but very low milage TS-830. Although it used to develop about 120 watts key down, I can only get about 40 out now. The plate HV reads about half of normal. The loading characteristics seem normal, it's just that everything is at reduced power.

Something with the power supply? Filter capacitors or rectifiers?

Any help would be appreciated.

From: "Matthew W. Steger" <n3ntj@erie.net>
Message-ID: <341944C7.C1CBE4EA@erie.net>
Source record: 166350

Hello all...

I got my GE MVP UHF rig to work and now I just have to make the mods on the new SAS board. The power output when I first got it to work was about 40W with a 1.4:1 SWR..now it's around 22W with a 1.2:1 SWR but the power drops when you key it up for more than about 3 secs. It drops at a rate that you can easily see it on a SWR meter. Does anyone have any ideas why this power drop would be occurring? The 10V reg. is heat sinked on another board, and this 10V circuit is hard-wired into the SAS board.
The radio heat sink gets warm after several minutes...this , I assume, is normal.
But I need to try to figure out why the power is only 20W now and why it starts to drop within a few secs after being keyed up.

Any ideas?

Matthew Steger

I can't say you're wrong about your set. But I do believe that on
mine, a Kenwood TH-78, the speaker is the 2.5mm and the mike/PTT is
the 3.5mm. If your mike has a headphone socket, it will probably be
the same size as the set's speaker socket.

I noticed that MFJ advertises different speaker/mike models as being
compatible with different HT manufacturers. Maybe the assignement of
the jack plug sizes differs between brands.

Regards,

Do you really need to worry about .1378 in. compared to
.125in.? These things don't look that critical to me. Besides, even
if they call it 1/8 in., i'll bet it's made as a 3.5mm overseas anyway.

Speaking of solvents...

Most RTVs use Acetic acid (like Vinegar) to keep the material fluid until it cures (that's what smells weird when it's curing). Acids and copper don't get along very well, so you might have deterioration in the tube's base wires (between the tube and the socket pins). For that reason, I would suggest finding a kind of RTV that is specifically usable in an electronic enviroment without corrosion risk.

Good luck,

73 Dave WB0GAZ dgf@netcom.com

Try RTV silicone rubber compound. Most epoxies will age and
crack after a while. The RTV will not. Glues with solvents should
not be used because they tend to shrink as their solvents evaporate
and loose contact between surfaces that have some gap between them.

I've been using my FT-50R in my Ford Escort for several months now. I'm using an MFJ-1729 mag-mount dual band antenna (which has a PL-259 connector but includes an adapter for BNC) with a BNC to SMA adapter to connect to the radio. I also bought the Yaesu speaker mike for the 50R. With the 5W out of the radio I can hit any repeater here in Colorado Springs with no trouble. The only problem I have is with cross-mod distortion (out of band signals combining to modulate in-band). With all the other signals here in the city I hear a lot of extraneous signals. You can get a filter to solve this problem, or if you have the FT-50RD and you listen to repeaters that put out tone on transmit, you can set the radio to require tone to receive. (I'm just living with the noise for now.)

In general, I'm happy with this arrangement.

5457. Drake SPR-4 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-13 00:00:00 UTC
From: BGuerney@WorldBank.ORG
Message-ID: <5ve43g$8jj$1@inews.worldbank.org>
Source record: 166163

Hi. I found a Drake SPR-4 at a garage sale. I have heard that this radio could be modified to a digital operation somehow. Anyone know where I can find information on how to do this? Also - I am looking for a Philips/Magnavox D2999 portable, if anyone has one they can part with for a good price. Thanks. Mailto: BGuerney@Worldbank.org

5458. Re: Drake SPR-4 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-13 00:00:00 UTC
From: radiomatt@aol.com
Message-ID: <19970913143001.KAA11282@ladder02.news.aol.com>
Source record: 166164

I dion't quite know what you mean by your question...
The SPR-4 only tunes in 24 fixed 500 kHz wide ranges. The calibration is pretty good (1 kHz or less). If you need better than 1 kHz readout you have 2 options..buy a frequency counter with pre-scaler which will show exact freq to 0.1 khz.

But I suspect what you really want is to cover the additional bands between the 24 you've got (there are 60 bands each 500 kHz wide between 0 and 30 Mhz...in your radio you're missing 36).

Drake did make a SWITCH-TUNED external oscillator to permit tuning all the bands, but it was a rare piece and worth lots more than the radio is.

If you need a digitally tuned radio,,,sell the spr-4 and buy something else, but before you do try it out. it is a serious receiver for the 24 minibands it does cover.

if you ever decide to sell let me know.
matt

> >

I suspected it was "BRAND NEW" since it doesn't look like anything I
have seen before. I go to the KENWOOD INTERNATIONAL WEB site a lot and
never saw this radio. They would have had it there even if it was
for export. The Kenwood TRC-80 is meant to compete with the Yaesu
FT-600 and the ICOM IC-707. These are "NO FRILLS" radios but get the job
done for a reasonable price $700-$900 price in USA DOLLARS.

Hi Folks,

I need to obtain a transmitter/reciever or schematics for a transmitter/reciever. I only need to send a signal about 50 feet. I must be able to tune a transmission to a certain frequency and then bandpass that signal at my reciever. I need to send two or three different frequency signals at different times. Where could I buy such a transmitter/reciever unit or obtain schematics. Please Help.

Also, what would be the best frequency to transmit over this short range to avoid interference from outside signals?

5472. SGC2000 trade for linear

Hello,

I have obtained a SHINWA SH404KG UHF Hand Held transceiver.

It origionally had xtals for 452/461 MHz (VK business band) but they where removed. Iwonder if some one has any infomation, especially the xtal formula so as I may order some xtals for the 70cm amateur band.

regards

Mark

5476. Realistic HTX-212 Mod HERE!!!!!!

----------------------
Realistic HTX-212 Mod
----------------------

If you own the Realistic (Radio Shack) HTX-212 mobile radio, you probably
know that the radio can recieve 136-174 MHz. You also know that it cannot
transmit in that range. Well, the sneaky enginners at Tandy sneaked one
little unpublished feature in. Yep, all band transmit. To enable all band
transmit, hold down <F>unction and <T-SQL> while powering up the radio.
Now you have "wide band transmit". You can transmit 136-174 MHz. But
remember, even if you ARE licensed to use a business band frequency, this
radio is NOT FCC Approved for those freqs, so DO NOT TRANSMIT OUTSIDE THE
AMATEUR BAND!! DO NOT RISK LOOSING YOU LICENSE!!! A big thanks goes out to
Skygod11@aol.com for providing me this info. On another note, if anyone
knows of any such "keypad tricks" for the Realistic HTX-202 HT, please let
me know. Thanks, and good luck with the mod. Compiled 9\14\97.

5489. Re: Collins SW-Receiver Service Manual Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-13 00:00:00 UTC
From: jdhoward@helps.helps.com
Message-ID: <5rqfv5.7f6.ln@helps.helps.com>
Source record: 166195

Fair Radio, P.O. Box 1105, Lima, OH 45802, telephone (419)223-2196
has copies of the R-390 manual. The copy is NOT bound. You get
an envelope full of loose pages.

W7FG Manuals (800)807-6146 has manuals, too.

I have a R-390/URR, too. I had it repaired last year by Rick Mish
at Miltronix in Toledo, Ohio. I am listening to it now, REE on
6,055 MHz. Good luck with yours. Here are some quotations from
other owners.

A year or so ago, Randy Zelick <RANDY@sbii.sb2.pdx.edu> wrote:

As you may recall, quite some time ago I tried to order an original TM
for a R390 (not A) receiver from NTIS. I succeeding in placing a credit
card order for same on the 13th of September.

Well on Saturday last (October 4) a package from NTIS did arrive, via
priority mail having been sent from Virginia 5 days earlier.

I got a very nice, very complete with latest mods, 390 manual! That's the
good news.

The OK-but-not-wonderful news is that the manual is a reprint and
inferior to the quality of a true original. Yes the schematics fold out,
and yes there are photos. But the photos are a bit fuzzy and the smallest
lines on the schematics show clear evidence of deterioration. It is
staple-bound and done on regular-weight xerox type paper, so the manual
is quite a bit thicker and more cumbersome than the true original.

It is remarkable that the government provides such a service in the first
place - one of things I am happy to pay taxes for, and so I'm not
complaining. Especially because the price is very reasonable ($24.00).
But if you are thinking of ordering a manual, you should know that it
won't be quite as nice as the ones made 40 years ago.

If you do decide to go for one, the numbers are:

TM 11-5820-
-357-10 operations
-357-20 organizational maintenance
-357-20P organizational maintenance repair parts
-357-35 field and depot maintenace
-357-35P field and depot maintenace repair parts

The number to order NTIS manuals is 1-800-553-6847, 9-5 eastern time.

Cheers,

=Randy=
Randy Zelick
Dept. Biology
Portland State University
P.O. Box 751

503-725-3086 (voice), 503-725-3864 (fax)

A year or so ago, ROBERT W DOWNS, WA5CAB,
<103012.2130@compuserve.com> wrote:

A posting here yesterday afternoon by Randy Zelick prompted me to stop lurking and say something. He reported having received a set of R-390 TM's but that they were reprints (copies). This wasn't done by NTIS. DA (Department of the Army), otherwise known in NTIS jargon as 'the proponent', apparently had quite a few of the mid 50's to mid 60's TM 11's 'reprinted', as they did earlier manuals in the 40's. They include, just to name a few, the TM's on R-390, R-390A, and AN/GRC-19, including those on components, such as T-195 and R-392. Unfortunately, as Randy found out, these reprints aren't of the same quality as the WW-II vintage reprints. They were done by zerographic process, rather than by printing press. The quality of the photos is good, but not excellent. The contractor could have done a better job (I do [commercial]). On the other hand, they are always complete, uncirculated, and have all of the changes incorporated, rather than loose. And, they're available! I have some NAVSHIPS manuals in my collection which appear to have been produced by a similar method.

I've dealt with NTIS for many years. They can supply technical documents from not only DA, but Department of the Navy and Department of the Air Force as well. Over the years, I think that I've had only four problems with them. During the run-up to the Gulf War, one of my orders went into the bit bucket, and I had to reenter it. I've had several requests come back flagged 'unidentifiable'. This may mean that the manual is no longer in the system. However, check the manual number(s) on their response carefully. On one early occasion, I found that they had entered the number incorrectly. For this reason, I strongly recommend placing orders with them via FAX, rather than voice line. And if your handwriting is about like mine, either use a typewriter or printer, or print very carefully. Their FAX number is (703)487-4841. Give them a FAX number to reply to. You will normally get a response of some kind within two working days. Once, I had an order come back flagged 'US Government Agencies Only' (i.e., 'CLASSIFIED'). The manual was on the I-199 dynamotor and generator test set, first produced c1943, so I doubted the report, and called St. Louis and confirmed that it wasn't. I replaced the order, and (almost) received what I ordered. The confirmation on the reorder said that it would be a paper copy. What I got was microfiche. Many of the older manuals are being put on microfiche. Fortunately, microfiche readers can be had for a reasonable amount (mine cost $130.00). Unfortunately, the contractor must have been the low bidder. The reduction ration used was non-standard, and the quality is slightly poorer than the hard-copy reprints previously mentioned. On the other hand, something is better than nothing.

Four other points. (1) NTIS charges are based on page count on a sliding scale. Their minimum, which was $9.00 the last time that I checked, is expensive for two pages. Their maximum (was $45.00) is cheap, for over 500 pages. And it doesn't matter if you order a thin one and a thick one. The price per manual is the same. (2)Their rules only allow one shipping/handling charge per order. (3)Be sure that you give them the correct number. If you tell them that you want TM-11-xxxx, and what you want is a Signal Corps or DA manual, you'll be disappointed. They'll enter it exactly the way that you sent it, and only the Marine Corps manuals have a hyphen between 'TM' and the following numbers. Computers are literal, as anyone reading this should surely know. (4)And don't ask for a manual for xyz radio set. To the best of my knowledge, Fred Chesson, Ray Mote and I have the only databases on technical publications for US military boatanchors cross-referenced by equipment nomenclature. Mine, which is also my equipment collection database, and includes cost and acquisition information and other accounting data, is currently at about 17MB, so don't send me a 360K floppy and request a copy of it! I have furnished a couple of copies, however. Anyone seriously interested can contact me. It's in dBase IV/5 format, and no, I won't convert it to ASCII or any of Bill Gates's trash.

Two publications which were, and I assume still are, available from NTIS on microfiche are DA PAM 25-30, CONSOLIDATED INDEX OF ARMY PUBLICATIONS AND BLANK FORMS, and NPFC 2002, no title listed, but the same thing for the Navy. These replaced earlier pubs dating back to the 30's, and list, among other things, all the manuals currently available on military boatanchors. Consequently, they basically list what you can get from NTIS. You might be surprised at the original pub dates on some of the items. These are reissued quarterly, and you can buy one, or a subscription.

Miltronix in Toledo, Ohio is owned by Rick Mish. He has
rebuilt two R-390A's and one R-390 receiver for me, and he did a
superb job. All of them were put back in like-new operating
condition. In addition to solving any electrical or mechanical
problems, he completely cleans the unit and repaints the front
panel and knobs, as well as the meter and digital read-out
covers. The basic charge for this was $250, plus the cost of
any parts or tubes replaced. Well worth the investment.

Rick can be contacted at:
Phone or Fax: (419) 255-6220
By mail: Miltronix
P.O. Box 3541
Toledo, OH 43608

A year or so ago Stan, WB5LBH, scgilstrap@aol.com, wrote:

In view of the fact that I was inundated with requests for
what it cost me for a Rick Mish R390A overhaul I have decided
to post the information to the list. This is the most

expeditious (and easiest) way to disseminate this information.
Thanks to all who responded and it was nice to hear from
those of you that I have corresponded with in the past.

- First the most requested information - the cost. Here it is
right off the invoice:

7 12AU7/5814 @ $6ea 42.00
1 6BA6/5749 6.00
1 6AK5/5654 6.00
1 6DC6 6.00
1 6AK6 6.00
1 T202 Antenna Xfrmr 10.00
1 Band Crystal (9 mc) 10.00 (for 15 & 24 mc band)
5 Power Supply filter caps 30.00
1 3-wire line cord 5.00 (for shock prevention)
1 1-lot of misc resistors,
capacitors and misc hardware N/C

Breakdown entire radio, wash and
degrease geartrain, check tubes,
clean controls, realign entire
radio, check all xtals for tolerance,
calibrate PTO, touch up front panel
and knobs. (Its not on the invoice
but Rick removed an extensive mod
that was not needed.)*

Parts 121.00
Labor 250.00
UPS shipping/packing/insurance 40.00

Grand total $411.00

In addition to the basic service I bought new top and bottom
covers at $50 for both and two type 'C' antenna connectors for
$10 each. The antenna connector goes on the unbalanced
antenna input. I got one for me and one for my brother who
got an R390A for Christmas last year.

Keep in mind that your price may vary. My R390A didn't play
worth a hoot but it was in basically good mechanical and
physical condition. Rick can give you a pretty good ballpark
figure on what yours may cost. It turned out that mine needed
more tubes than he estimated. Thanks to that diode mod I put
in the power supply.
Also, he returns all the parts he replaced. Yes, bad tubes too.

- Next question - Shipping.

Rick will tell you: Buy a double-wall cardboard box 22"x24"x14"
and get about 40 paper grocery sacks. Wad the grocery sacks up
for packing material. They don't compress in shipping like the

foam peanuts. I was able to get foam pieces at work that we receive our high dollar avionics gear in. Just made for shipping a Boat Anchor. I lucked out there. So I was only out $12 for the box.
Before shipping Rick told me to turn the rig over and remove the power supply. This saves about 20 pounds shipping weight. And all you're removing is the transformer and rectifier tubes, which he obviously doesn't need on his end. He'll ask you to send the rectifiers to check them if you like. My shipping weight came to 70lbs and with $1000 insurance the UPS bill was about $18 to ship from Tulsa, OK to Toledo, OH. He said he's only had two units damaged in shipping in all the years he's been doing this.

- Turn around time?

It will depend on how busy he is. My radio was back in under six weeks. I expected two months but Rick was able to get to it sooner than he thought. The radio languished in the attic for a few years so a couple of months more seemed like nothing.

- Does he restore other radios besides R390s?

I honestly don't know. You'll need to give him a call about this.

- Whats the cost of his rebuilt R390As?

Rick said he's selling a rebuilt R390A for $850. About half the price of an NRD-535. He told me that another customer of his has both and the R390A can pull a signal out of the mud better than the sand-box. Why? Those digital rigs produce noise slinging those 1's and 0's around.

- Address and phone number?

Rick Mish - Miltronix
36 E. Manhattan Blvd
Toledo, OH 43608
Phone/fax: 419-255-6220

*The mod Rick removed was evidently a depot mod. It allowed the use of external oscillators for extremely accurate frequency control and stability. Not having the external oscillators I had no use for the extra hardware so Rick removed it and returned it to me.

I'm not quite sure what you mean by "digital operation". There was an
article in Ham Radio magazine for August 1972 by Robert S. Stein
entitled "Frequency Synthesizer for the Drake R-4" that described
a synthesizer to replace the crystals needed to tune each 500KHz segment,
thus giving it full coverage of the shortwave spectrum from the broadcast
band (or close to it) to 30MHz. I thought the conversion scheme of the
SPR-4 was similar to that of the R-4, meaning that the synthesizer could
be used with the SPR-4. Of course, that design is a quarter century old
now and there are better devices nowadays to come up with the same
results.

I can't see what else you could do to make it "digital" without
modifying the receiver, or whether you are thinking of digitally
controlled frequency or digital signal processing in the IF.

Hi to all, I'm in need of 3 Sigma relays.

the numbers on the relay are:
49RE1C1VW - 12DC-SCO
10A, 28VDC/12VAC
TV-3
360VA 240VAC MAX
Pilot Duty

Anyone know where I can buy them NEW.

I know I could match them with something else but I'd
like to use the originals.

Thanks, Mark N2FLF

I have just finished my new keyer based on a Microchip PIC microcomputer I.C.

Check out my web page at:

http://members.aol.com/k1el/index.html

or e-mail me for a text only description.

Brief Description:

The K8 Keyer is a low cost automatic Morse keyer designed by Steve, K1EL
and implemented in an 8 pin Microchip PIC (TM) microprocessor. Only a few
external components are required to build a keyer using the K8 Keyer I.C.
The K8 provides directly adjustable sending speed, both callsign and
message memories, a built-in sidetone oscillator, straight key emulation,
and even a code practice mode

Source record: 166059

Hi all,

I plan to take an HF rig for my brother in India. I have a
Yaesu FT-101 that I've sent to Yaesu for service. However, I've heard
that the receiver on the original 101 is not that great and I'd like
to know what the issues are with this receiver and if upgrade kits are
available to fix these. I do plan to ask the service guys the same
questions but thought I could use the experience on this group.

Also, if I decided to get a more recent radio
to take instead, what would be a good beginner HF radio ($400 budget)
that I can get second-hand? I would like to get a radio that is not
very computerized since he wouldnt be able to service it if something
went wrong.

Thanks
Ashok Srinivasan

>between frequency control and volume control.
You do not have to use the function button to adjust the volume. All
you need to do is press the little button above the PTT and then use
the UP and DOWN buttons on top of the mic. You can set the volume
button to only hold in the volume mode for a short time or to be a
sticky type where you press it once and it stays in the volume mode
until you press it again.
>
>There are a few other things missing from the W32. No touch-tone "paging,"
>no clock, no priority channel.
The Z1A also has tone decode included so that it will find the PL tone
of a repeater automatically/
>

>and W32, you can't charge a battery when off the radio, using the wall
>charger. No adapters are available. You need the drop-in charger. They
>run about $90 new.
The Z1A will charge with the standard wall cube or from 12V car
battery when off with no problems. I do it all the time with 3
different Z1A's.
>
>And for K2GT's off-frequency problem -- I haven't run into that here.

5518. Super CMOS III Keyer died -- Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: ka0rny@midusa.net
Message-ID: <341c6cfe.127490633@news.midusa.net>
Source record: 166069

Hi All.

I have a Super CMOS Keyer II I built after it appeared in August '95
QST. This unit has worked flawlessly for the past year and a half and
today it died. None of the tricks I tried could get it going again.
Does anyone know if the creators of this unit might have email
addresses so I could ask some questions, or do I put the heat on ARRL?
The booklet says power should be removed for one minute and it should
come up working, well mine doesn't... :-(

If anyone has had a similar problem and resolved it, please write.

73, de Nate >>

I beleive the differences are:

FT-50R original radio low power battery
FT-50RD Digital voice and ctcss decode board installed
FT-50RH High power version (higher voltage battery, same radio)

My dad has a Radio Shack HTX-242 Two-Meter Mobile Transceiver he is trying to sell. He's had it approximately one month, and only used it once. It is still in the box, and has a 3 year warranty (anything breaks take it to Radio Shack.) $280 + shipping and handling. If you have any questions, e-mail me and I'll relay the message to my dad and then write you back.

Thanks,

Jaymz

From: Rich Wall <richwall@asan.com>
Message-ID: <01bcc0bf$fe580880$416f14ce@richwall>
Source record: 166082
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I bought a 79A and quickly returned it. There is no way that rig can handle
the "average" duty cycle of a "typical" ham rag-chewing with 5 watts out.
Heat dissipation seems inefficient enough unless you want to see $400 burn.

5532. FTV=WEFAX,FAX,SSTV,RTTY,CW with SoundBlaster

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC

Message-ID: <5vggo7$m2c@news.keyworld.net>
Source record: 166083
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.scanner,rec.radio.shortwave

FTV (now in Version 1.0)can be used to receive images from Weather
Satellites and Terrestrial Facsimile Stations, text transmissions from radio
telex services, Morse code, as well as Amateur Radio FAX, SSTV, RTTY and CW
signals. It can also transmit Amateur Radio FAX and SSTV. No external
hardware, other than a radio, is required, as all the necessary signal
processing is implemented in software. The main features include:

WEFAX, FAX, SSTV, colour SSTV, RTTY and CW operation.
Transmits 6 FAX modes, 8 monochrome SSTV modes, 10 colour SSTV modes.
FAX operation supports APT signal recognition and scheduled reception.
No external decoder or converter box is required.
Signal analysis is provided on all modes.
Many parameters are adjustable while receiving.
Full recovery from wrong mode settings is possible.
Program works in real time (about 1 second 'DSP' time lag)

You may get more information or download a copy from my web site, on
http://www.geocities.com/SiliconValley/2504

The TRC-80 is similar to the TKM-707, which is Kenwood's marine band
radio. The TKM-707 has been in the marine line for at least 7 years and
is still a current radio for SSB marine. The TRC-80 basically uses the
same chassis design but made for other countries for specific uses (not
ham) outside of the U.S.

As for the 5 or 7 year(TKM-707) statements those are my guesses, but the
point is that it is not a replacement for any ham radio marketed in the
U.S. and is certainly not new.

>this
>true?
>Mike
>kc2kj

I would have to agree. You need an SWR tester like the MFJ-259, or equal, because resonance for any given band could easily be outside of a ham band. Sometimes way out.

To make matters worse, some of the bands interact, so if you tune one band perfectly, then tune the interacting one, then go back to double check the first one, it's out of resonance.

The last thing that's tricky is the reflector. When I set the reflector to the lengths in the instructions in the manual, it resonated all wrong. The best way I found to do the reflector is to tune the driven element with no reflector installed. Write down the resonance points, then install the reflector. Every resonance point should be reduced in frequency by the proximity of the reflector. If it isn't, tune the reflector until it is. (Recall that the reflector is resonant at a frequency roughly 5% lower than the driven element.

Does the Butterfly Beam work? Yes it does! But it's not as good as a full size beam. I like mine.

Source record: 166111

Hi,
I have a old kenwood mobile 2m radio TR-7950 and everyone I talk to says my deviation is too low so they can hardly hear me. I have looked through my manual and it doesnt mention which pot might need adjusting. I would apreciate anybody who could help me out with the answer.
Also while were on the subject of deviation, I have the exact oposite problem with my HTX-202. I dropped it and now It has very high deviation. This may be more difficult to fix since it is a handheld and it was caused by dropping it.
Thank You,
Trent KF6BUY/AA

Hi,

My Kenwood TM251A runs real hot during long QSOs. I was
wondering if anyone can recommend a good rig that can run QRO
without getting too hot? I have in mind maybe the YAESU FT2500M
or the FT3000. Can anyone comment on this or recommend a rig? Thanks.

5543. Help: Ameritron RCS-4

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: bragassa@hal-pc.org
Message-ID: <341cd492.7287103@news.hal-pc.org>
Source record: 166117

Does anyone have a manual for a RCS-4? This is the antenna switch
that uses the coax as the power source to the remote switch in the
tower. Where should it be placed in the system? I cannot see it being
AFTER the amplifier, due to possible power limitations of the RCS-4..
But it probably should be placed AFTER the tuner?

I tried it right at the xcvr and it would not work. From my xcvr, the
feedline goes through a low-pass filter, to a tuner and then through a
1 kw. amp and on to the antenna.

regards,

Mike, K5UO

The usual technique to straighten wire is to run it through a series of
rollers (just like wire straightens when you draw it over your fingers with
a band).

The easiest way to do this for small quantities is to drive a series of
nails into a board in a zig-zag fashion so that the wire bends around each
nail. What pattern spacing - you will have to cut and try!!

I have done this with silicon bronze welding wire to make colinear
verticals - it works well (this alloy is better for making antennas than
stainless or piano wire.

In the long run the industies determine who is qualified and not. If you
can't do the job, what good is a bunch of diplomas ? I've known degreed
engineers who had no business working in their field as they were totally
incompetent. Often the technicians are more knowledgeable than the
engineers in some industry related fields.

5547. Mint Kenwood TS-830S for sale, third round.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: morinm@csgoeland.qc.ca
Message-ID: <874242763.31766@dejanews.com>
Source record: 166121
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

This is my third posting about this radio. I got lots of inquiries but a lot less serious offers. The TS-830S is a late model with GOLD lettering under the tuning knob, the serial number is over 2 million. The radio is in mint condition and comes with the MC-50 microphone on the desk stand. I also enclose the instruction and service manuals.

The TS-830 is a base station radio, which means it plugs into a standard wall outlet. Its specifications put to shame every modern HF rig that sells for under $1500. new right now. It covers every ham band from 160 to 10 meters and also the WARC bands. It was Kenwood's Cadillac when it came out in 1981. It is all solid state except for 3 tubes in the finals. It has 220 watts PEP on SSB and 180 watts on CW.

There are more controls in the receiver section than in 3 modern low cost rigs combined. Which means there is everything you could ever ask for except DSP which wasn't invented yet in 1981.

The asking price is $450. U.S. and I will pay for shipping by surface mail and insure it for its full value. I hope that answers most of the questions you might have about this fine rig.

The reason I want to sell it is simply because I want to get a rig that offers general coverage in the receiver section and I don't want to buy a receiver, that's all. Please email if you have any questions.

Rig is in mint condition.
Late model with GOLD lettering under tuning knob.
Serial number in the 2 millions.
Covers every HF bands including WARC.
Comes with MC-50 desk microphone.
No additional filter installed.
Base station, plugs into standard AC outlet.
Includes instruction and service manuals.
220 watts PEP on SSB, 180 watts on CW.
Lots of goodies in the IF section.

Asking price is $450. U.S. not negotiable
and I pay for insurance and shipping by
surface mail anywhere in North America.

Will not be sold to someone who hasn't got
access to email. I have been burned twice
before and lost a lot of time in making
long distance phone calls. The last buyer
had me wait 2 weeks before telling me that
he did not have the money to buy the rig.

Only serious buyers need apply this time.

Send all inquiries by email.

I just saw it too! I congratulate TEXAS TOWERS for being the first USA
HAM DEALER to list the IC746 UNDER "SPY PHOTO"!
Texas Towers is NOT offering it for sale yet since it is not FCC
approved but they are saying it should be available this FALL.
Also, Texas Towers is one of the Dealers who I feel has the best Prices.

Unless you specifically want the "removable control panel" feature, I'd recommend the W32 over the Z-1 (I have both).

The W32 is thinner and a bit lighter, and has twice the memories. But most important, the volume control system on the Z-1 is terrible. You have to use the function button on the side of the radio to change the top knobs between frequency control and volume control.

There are a few other things missing from the W32. No touch-tone "paging," no clock, no priority channel.

A new W32 is going for between $330 and $350 if you shop around -- quite a bargain.

Considering your Z-1 offer, the big question is what's the "charger." If it's the wall-cube, that's standard. If it's the BC-119 or equivalent drop-in charger, that makes the price more worthwhile. With both the Z-1 and W32, you can't charge a battery when off the radio, using the wall charger. No adapters are available. You need the drop-in charger. They run about $90 new.

And for K2GT's off-frequency problem -- I haven't run into that here.

73,
Gary

>pauloa@centroin.com.br

Hi, Paulo

The info you want is below, In the future, please do not send this kind of request to the inappropriate newsgroups. My software shows you posted to these groups:

rec.radio.amateur,
rec.radio.amateur.antenna,
rec.radio.amateur.equipment,
rec.radio.amateur.misc,
rec.radio.amateur.swap

It clearly did not belong in "antenna" and "swap."

Sure, everybody wants maximum coverage for their questions, but give the newsgroup readerss a break -- they look at specifically-named newsgroups for a reason. If everybody just posted everything everywhere, WHAT A MESS!

Now, here's the W32 info... (sorry you caught the attention of a natural-born newsgroup cop...)

To extend the receiver and open up 800 MHz receive (cellular is blocked):

-- Turn off the radio

-- Press and hold the band and squelch buttons.

-- Turn on the radio while holding these buttons,
wait for 5 seconds before you release the band
and squelch buttons.

-- Now the receiver should be opened up as far as it will go.

To enable Crossband Repeat:

-- Set the VHF and UHF frequencies you want to use.

-- "Lock" the radio by holding down the CALL/LOCK button
for two seconds.

-- Turn off the radio.

-- Hold down the SQUELCH button (above the PTT button),
the MAIN button and the BAND button.

-- Turn the radio on while holding these buttons. The "LOCK"
indicator (a key icon in the upper right side of the display)
will be flashing, and the radio will be in crossband repeat.

To disable Crossband Repeat:

-- Hold the CALL/LOCK botton down for two seconds. The "LOCK"
indicator will stop flashing, unless...

-- if the crossband repeater is in use, holding the LOCK button
won't turn it off. If you must shut it off in that condition,
press and hold the SQUELCH button, then hold the LOCK button
for two seconds, and the "LOCK" indicator will stop flashing.

From jones1@alltel.net Sun Jul 20 09:43:46 1997

The mod for out of band transmiting is as follows:

Remove the four screws on the back of the radio and the
two screws under where the battery is.

Lift off front of radio(keypad). This is the logic unit.

There is a chip diode at the back of the logic unit.
The number is D523. Remove that diode and it will allow
transmit out of band on both 2 meters and 440.

5564. Antique radio tubes

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: voicebox@dnai.com
Message-ID: <voicebox-1409970842520001@dnai-204-188-12-144.dialup.dnai.com>
Source record: 166138
Cross-posted to: sci.electronics.repair,sci.electronics.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

I have an antique AM/SW radio (1941 Philco "model 41-280, code 121") and need to get the tubes tested. The problem is that they are so old that the tube numbers don't show up on any tube tester listing that I've found, except for one that was part of a fellow's antique radio-and-test equipment collection at a local store (now since gone).

Any suggestions? I guess if I could find tube equivalents, I could test them on modern testers (?) Every tube cross-over book I've looked in doesn't have these.

The tubes are:
7A4
41
7C6
7B7
84 (a.k.a. 6Z4)

Also, are there any good mail-order source for these tubes?

Any suggestions would be greatly appreciated. Direct e-mail replies, doubly so.

Thanks.

Enjoy,
Dave

To get rid of or disable the expanded Rx. Just do a compleat system reset.
This of course will wipe all memories. Then if you want the mod back
later just do the key board mod again.

(I guess it's a small price to pay if you are going to be in Kentucky

Ed,

Generally speaking, nothing can be "modified" for use in
any service other than Amateur. For the mostpart, all
equipment meets standards for a given service and is
documented by the FCC as being in compliance with those
standards. This process is called type acceptance. In
some instances, you would have to submit "n" quantity of
the "modified" unit for the FCC to verify as meeting the
Type Acceptance criteria.

Of course, because Amateurs are tinkerers and modifiers
of equipment by nature, any equipment may be modified to
operate in the Ham Bands as long as it meets Amateur
criteria (freq, harmonics, etc.) once the mod is done.

That said, the modified unit may not be used for the original
service - once modified for amateur use.

Regards, Dave

I would use Appleworks for the logging-I have yet to find a database program that works as well as Appleworks did while I was using my IIc, and Apple Packet Radio is a good packet program. the IIc is actually a good computer for amateur use, as it's compact and very quiet, both audibly and RF wise. 73's de Chris WL7PV

From: Gary Sanders <NOSPAM/gsanders@gte.net>
Message-ID: <5vhhi1$92t$1@gte1.gte.net>
Source record: 166150

Does anyone have any information on a model CSI-22
repeater tone panel, made by:

Communications Systems Incorporated.

Note that this is _NOT_ Connect Systems Inc., which
also goes by the abbreviation CSI, (and which I,
unfortunately mistook it for). It is also _NOT_
Communications Specialists, Inc., which also is
sometimes known as CSI.

It has 4 - 7 segment LED displays, several status LED's,
10 programming buttons and an "enter' and "reset" key.

On power up it scrolls "C 1986 CSI" on the 7 segment
displays.

Unfortunately, I don't know how to program it, so I
don't know if it's working or not.

I need connection and programming info, along with
contact info for the company, if they are still
around.

I'm willing to pay a reasonable fee for a manual or
a copy.

Please respond via email, and remove the "NOSPAM/".

Thanks,

Gary

Cu wire can be straightened by tensioning it and twisting it at the same
time. It might work with your piano wire.

Try going to a music store and buying a guitar string (metal) they are coiled when you get them but but once unwraped are straight. Makes a nice little antenna, but put some tape or something on the tip (quite sharp). stan/kb8jlv

Ray's correct, you can take it anywhere, because it's very small and
light-weight. Thus, I take it with me to work and practice during my
lunch hour. I also take it to a quiet room in the house when I practice.

If one is willing to take the time EVERY DAY to practice, the unit can be
useful tool for learning code.

As for the $80 price, there are 3 different units, an $80 ($79.95) unit,
a $60 unit, and a $40 unit. I'm sorry, but I forgot the part numbers to
these unita and I can't find the information sheets on them.

The $80 unit has an LCD and the USER DEFINED CHARACTER SET. Which is
critical to a beginner like me, because I add 1 character at a time to the
set as I learn them. (Limit of 16 characters to the USER DEFINED SET)
This unit remembers your settings when you turn off the power.

The $60 unit doesn't have the LCD or the USER DEFINED SET, but it DOES
remember your settings when you turn off the power. If you already know
all the characters, it would work well for picking up your speed.

The $40 loses the settings every time you turn off the power. :-(

As for the price, I feel it's a bit high for any of the units. The parts can't cost too much. So I think it's a case of MFJ knowing that they have a product that no one else has.

Oh well, if I tried to build my own using a BASIC STAMP I or II, it wouldn't be as good and would cost me more. <smile>

73,

Bob

I recently aquired a strange device. It looks like an eprom burner it
has an led display , dip socket, monoplane keyboard and serial cable.
This device was made by 3M. Sticker says "Refer to 3M EMT 9140 Field
Srevice Handbook ... for operating instructions.
Does anyone know what this is? Is it an eprom burner?
Any help would be apprecited.

Thanks Ron

5583. TV-2 TUBE TESTER WANTED--TIRED OF USING IT?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <5vhmdd$88d$5@csu-b.csuohio.edu>
Source record: 166157

TV-2 Series military tube tester wanted. Maybe you're tired of all the settings to test a simple tube and I can provide a decent easy and quick to use replacement unit as part of the deal for your TV-2 if you wish.

I am not a dealer, but an old full-time student trying to get out of school before social security sets in :) I have become fascinated with tube testers and wish to collect them as strange as that sounds to use with my collection musical instrument amps of that I have gathered over 30 years. In reality all anybody really needs is one basic Gm unit-nothing more if you think about it. I realize this.

I am long on things to trade (some very nice valuable goodies in various categories) and short on cash--hopefully we can perhaps work out some combo of things to swap and/or straight cash. Actually, if you decide to swap in some form, you'll come out far, far ahead of the pittance that dealers will offer you for a unit when they buy a TV-2 considering the value of some of the goodies I have to swap if you can use same.

Please, no dealers--as a full time student doing this as a hobby with my wife rightfully watching my toy expenditures, I cannot afford any tube tester that has suddenly become solid gold after it has been purchased for a pittance. I am not being critical--I realize dealers are in business to make as much money as possible with caveat emptor.

Thank you.

5589. Re: Why the term ---HAM---

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: "Gregory T. Helding" <gth@execpc.com>
Message-ID: <01bcc0b0$60b234c0$342afacf@gth>
Source record: 166204
Cross-posted to:
rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I read that the term was first used in a telegraph operator training guide.
A ham (not an acronym) was a bad or inexperienced operator. This was
before radio. When radio came about, there were not the regulations and
restrictions we have today, so people operated wherever and however they
wanted. The troublesome operators were called hams by military operators.
This name stuck and eventually the term came to mean all amateurs, not just
bad ones.

5590. Wanted: Crystals for Maxon CP-0510-P

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: richardb@evansville.net
Message-ID: <341b67f2.8168006@204.120.16.3>
Source record: 166205
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.swap

Hello

I'm looking for crystals to put in a Maxon CP-0510-P (I think
that's the model) handheld radio.
This is for some radios used at a local business here, and I'm
unsure what frequencies these are on now, but I'm sure they are in an
unlicensed business band. The radios were purchased with three
frequencies set, and have a fourth position open.

Getting to the point:
Where is a good source for these crystals?
(Well-known and on the net preferred, but whatever...)
Do these require "Maxon-type" crystals, or does one fit all?
(No, I wouldn't recognize a crystal if I sat on it...)
Anyone have an idea how to replace the crystals in these
things? We took the battery pack off the back, and found a flat metal
plate with several screws holding it in. Do we remove it to reach the
crystals? Go in another way? Am I braindead, and this radio not use
crystals?

Any help would be greatly appreciated!
Rich

I used to own one. The thing that drove me nuts about it was the
rather clumsy way function key/push button approach to adjusting
the volume. It was a pain. Otherwise, it was an interesting rig.

5593. Straightening Wire for Whip

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-14 00:00:00 UTC
From: gadgeteer@pobox.com
Message-ID: <5vfq6r$bm5@redstone.interpath.net>
Source record: 166208
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I've seen where people have used small diameter "piano wire" and the like
to make a quarterwave whip for their handhelds.

However, the wire I see avaiable is in a coil, and I can't seem to
straighten it so that it looks acceptable for a whip.

Does anyone know the best way to straighten this type of wire?

Thanks for the info,
73,

Source record: 165962

Another option is the "ear bud" earphone that has a mike on it a few
inches down the wire. Yaesu makes this. It is very small and you get very
good audio right into your earphone rather than a speaker that can get
drown out by road noise.

The earbud lapel mike is very inexpensive and works great when you dont
want a speaker blaring or need to be less obvious. The size of the mike/
earphone is tiny.

=73=

: Ditto.

: I also second the suggestion to get the speaker/mic. I clip it on the
: shoulder strap of my safety belt and it's very convenient.

: Also, you *can* get PL-259 direct to SMA adapters if you look. I found one
: at a hamfest today.

: If you are worried about NiCd memory issues (although supposedly they are
: imagined), I run mine off the cig. lighter with no batter pack on it.

: Finally, I am a little concerned about how my coax has gotten flattened out
: when it gets jammed in the door. This is supposed to change characteristics
: in a bad way. See if you can find a way to route it so it's not getting
: directly flattened.

: Bill

I would be a little concerned with the reliability of that amp, given the reputation of the parent company.
Looking over the QST review I note that it weighs only 2 pounds more than the old Heath SB-220 wheras the Alpha and QRO have enough transformer heft to truly support the 1500W + level. Also the replacement cost of the 3CX800A7 is quickly approaching $400 each.

The Alpha 91b would appear to be a better long term investment .

Source record: 165971

Let's face it. All mobile rigs are subject to thermal-runaway due to their compact size in any QRO requirement. The obvious differences between all manufacturers are their thermo-protection circuits and the size of their heatsink (size and speed of fans, too!)

I can't comment on who has the killer thero-protection circuit that has ever made; however, common sense tells me that the more heat one can dissipate, the cooler the rig runs. I personnally don't trust those little fans blowing small heatsinks found in those new radios because not only they burn the finals, but also burn my pocket, too!

After trying the FT-2500, FT-8000R, I have concluded that the IC-2000H be my best choice. Yup, it doesn't have a fan, but it has a large (largest in the same class of radio) heatsink that allows me to conveniently strap a 12V brushless 4" muffin fan on top of it. Now I have the largest fan/heatsink combination in the market!

I am long winded and running QRO in the car daily, but the rig runs warm to cool depending on the ambient temperature. Yes it looks a little odd and the intermod is still there (I don't think it is an intermod figther as ICOM claims), but I have a mobile rig that doesn't run hot hot.

Best 73!

5607. YAESU Bandscope software

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-15 00:00:00 UTC
From: David Ho <davidho@one.net>
Message-ID: <Pine.LNX.3.95.970915125932.9405A-100000@shell.one.net>
Source record: 165972

I don't have any Yaesu HF rig (yet!) and I don't know if this is new.
Just thought that someone might find this page interesting for many of you
Yaesu users:

http://www.yaesu.co.jp/experts/inde4999.htm

It seems that the bandscope software is free to download:
FT-1000 download 1000scp.exe (250k)
FT-1000MP download mp-scp.exe (250k)
FT-920 download 920scp.exe (251k)
FT-900 (850/840/FRG-100) download 900scp.exe (253k)

It's OK not to read their Japanese homepage, just look for the highlighted
links. I tried to install the software and found lots of Japanese
characters with some English. I don't have YAESU's CAT system and my NT
doesn't seem to like the software.

For those of you who have tried it, please post the result and let us
know.

I seems like this is the YAESU's answer to ICOM's build in bandscope.

Best 73!

Hello all,

Having recently started vhf dx I'm after a source for beep tone kits, you know, you de-key the mike and a beep is transmitted. Pretty good for marginal conditions which is most of the time with 2.5 watts! I'm after the straight beep, nothing fancy like a K tone, and preferably one that goes inside the mike.

In rec.radio.amateur.equipment you write:

>DOes the FT-920 have IF-DSP or AF-DSP?

AF DSP. Subject to AGC pumping when big signals are in the IF
passband. Very well implemented though, very effective even
though it is outside the AGC loop.

>Does it have triple or quad conversion superhet?

Neither. My understanding is that is is much like the 890 and 900.
It is basically single, though you could call it dual
conversion if you count the 1st IF up in VHF where there is a
really broad roofing filter. There is only 1 IF where you can
put a crystal filter.

Note, however, that this may be illegal in your state. Wearing of earphones
while driving, even buds, even just in one ear, is illegal under the motor
vehicle codes of some states (Georgia is one). Dumb? Maybe, but you'll
still have to pay the ticket if you get caught.

Don't think one could exist! Every ham has a variety of different
equiptment then the next so would be hard to design a generic. Orient your
gear the way you like operating it es do some measuring. Wrap-arounds seem
to be pretty versatile and make the unit so it slides out easily from the
wall, whether it's a stand-alone or sitting on a desk. Another nice thing
I've seen is incorporating in adjustable shelves for future additions or
deletion of equipment.

Hope this helps ya'.....73....Dwight....KB9JAI

Meters are very different from metres in the UK, the first are
instruments for measuring and the second units of length.
God forbid the Internet forces us into accepting American spelling
here.

Add to greg`s quote the fact that large hands were/are sometimes called
"hams" and that they were thought to belong to "heavy handed people"
which may result in a "poor fist" then we start to get a plausible
answer.

When I firsted hamming -(about 30 yrs ago - no longer active) I seem to
remember the Radio Amateur`s handbook had the facts about the term but

I have the brochure from yaesu. It is DOUBLE CONVERSION with DSP in the
Audio Stage. Nice sounding radio. The DSP doesn't sound echolike or
unnatural like other DSP Boxes or radios.

Legally speaking there are specific standards for both the tone and the speed. I don't have the specs in front of me so I'm not going to guess. If someone feels the tone is important to their ability to copy (such as someone with severe high frequency hearing loss) they would need to talk with the VE (as you suggest) -- in some situations this could constitute accommodating a handicap.

The speed is required to be straight CW - mathematically defined in the FCC specifications. I don't know if everyone actually follows that part of the rules -- The last time I took a 5wpm code test it was given by the FCC and the code was definately farnsworth (which I found easier to copy).

>How about the cigarette lighter adapter for external power? Will this
>setup extend the range significantly?

If you have the 9.6 V battery already, the cigarette lighter adapter
won't give you any more RF power output - but it does allow unlimited
use without discharging the battery (indeed, you can charge the
battery at the same time).

The FT-50 has louder clean audio than many handhelds, which helps.
Almost any external antenna will work much better than the rubber
antenna used inside the car.

You can also add an external passive or amplified speaker (for louder
audio), an RF amplifier (transmit power equivalent to a mobile radio),
or a bandpass filter (for reducing the intermod you're likely to suffer
when you put a better antenna on the FT-50). You end up with a
mess of cable after a while though.

Hello radio amateurs. Name here is Tim and callsign is N2QM. I have an Icom 706 with original boxes & all documentation. Radio has mobile mount and mobile DC power cord. I am the original owner. 706 has been MARS/CAP modified, and also has been factory modified with enhanced audio option. Also factory modified with protection diodes for 2 Meter receive. Let me explain - 706 was know to overload 2 meter receive when transmitting on 6 meters. Protection diodes were factory installed to prevent this from happening. I also will throw in a huster mobile antenna system which consists of the Hustler base, and separate coils for 10/20/40/75. $900 takes it all including shipping. E-mail to timn2qm@aol.com or tim73@mhv.net or call me at work (212) 939-7994 (NYC).

I have a dozen 1940's-vintage Army Signal Corps transmitter antenna
tuners that I need to sell. These units have the TU- designation and
are built for various frequency ranges in 80->20 meters. They have
vernier dial drives and are loaded with heavy duty RF parts inside, and
could be
modified or used as parts for a homebrew tuner project. They are rack
units and are mounted in their CS-48 metal transport cases. Some
are complete, while some are missing some front panel pieces such as
a rack pull or a knob. I'm asking $10 to $15 dollars apiece, depending
on condition. If anyone is interested in these, please email me and
I will send back directions to my place in Newberg, Oregon where I will
be available Friday evening (9/19) or on this coming Saturday (9/20)
morning. I will *not* be shipping these.

Mark Gaidos

I think the Lincoln is the the non-U.S. version of the HR-2510. Try
searching for info on the HR-2510 and the info you find will most
probably be the same or similar for the Lincoln.

This is a best guess... I haven't owned a Lincoln, I have just seen a
picture of one (an HR-2510 with some colored buttons).

Mark,

Contact Paul Darwactor (W8ZD) at (419) 424-8765. He custom makes the
connectors to fit your Hardline. Costs range from $32 to $39 for a
pair of transformers.

Hi,

I would like to build a mc68hc11 based morse code generator and decoder. My plans are to start with a dumb terminal or pc (in terminal mode) as the input to the microcontroller.

As the user types, morse code is sent to a speaker and or to a suitable output to be interfaced with a radio. Also, I would like to be able to use the hc11 to decode incoming morse code and display it on a pc or built in lcd display.

I know this probably been done to death, but I am having a tough time locating c, c++ or assembly code and algorithms. I would also like to see any hardware info if it is available.

I have been out of ham radio for some time, so I thought this would be a good project to start with.

I can use the information even if it is not directly for the hc11, any related information will be helpful. I am using linux and win95 and am not particularly interested in doing this via sound card, though the software may be of some help.

Thanks,

KD9GN@vnet.net

p.s. feel free to cc my email on any responses.

Ditto.

I also second the suggestion to get the speaker/mic. I clip it on the
shoulder strap of my safety belt and it's very convenient.

Also, you *can* get PL-259 direct to SMA adapters if you look. I found one
at a hamfest today.

If you are worried about NiCd memory issues (although supposedly they are
imagined), I run mine off the cig. lighter with no batter pack on it.

Finally, I am a little concerned about how my coax has gotten flattened out
when it gets jammed in the door. This is supposed to change characteristics
in a bad way. See if you can find a way to route it so it's not getting
directly flattened.

Source record: 166094

Danny,
Of the 5 or so local hams I know using the 2500, not one has complained about overheating and they are all being used as a mobile in kind of a cramped space. This is a mil spec unit and has an extra large heatsink so this is reasonable. I see that the 3000 has twin fans and any Yaesu I've owned which has even 1 fan has run cool. I'm using a FT212 in my car. It's an older unit with no fan and I've really got the thing cramped in between the dash and console . It runs at 45 watts for long periods and I have no overheating problem
Over the years it's been my experience that Kenwoods and Standards are the worst for overheating. The TM742's regularly blew out finals and they did have a warning in the manual about limiting transmission time on high power. Icoms seem ok. My IC2350 had a fan which blew air right through holes in the chassis and out holes in the front. It really operated cool.
In general, look for a large heat sink area and/or a fan.

>720 Hz I believe and Farnsworth is usually employed below 20 wpm.

This depends on the VE team and the policies of the VEC with which
they are associated. The ARRL VEC requires Farnsworth Code spacing,
some of the other VECs use proper Morse Code spacing instead. So it pays
to check ahead of time with the team who will be giving the exam.

(A friend of mine was stymied because he had learned 5 WPM Morse
Code and tested with an ARRL VE team who sent Farnsworth Code
instead. He retested with a team using Morse Code and passed.)

Tone frequencies (and purity) can also vary depending on the equipment
used by individual VE teams. Room echo can also be a factor if they don't
use headphones for the test. Again, prior consultation is a good idea.

I have a BRAND NEW in the box 5CX1500 Eimac tube that I bought a few years ago for when my Henry 4K needed a new tube. I sold the amp (working just fine) with the old tube in it and never needed the NEW tube.
It runs over $1300 new from Eimac.
This tube has been and is still in the possession of Ted Henry of Henry Radio. I kept it there because I thought I would put it on consignment. Well they no longer do Ham Radio as a retail business, so I offer it here. You can call Ted and he will vouch for this tube!

I ask $475 plus shipping.

If you're tired of duds or other junk tubes, you will be pleased to solve your tube problems with this NEW tube. Probably last as long as you do!

Tony,
The term general coverage receiver means that the receiver covers all
frequenies, usually from 500 Kc thru 30 MHZ. A 1KW amp is an an amp that
will put out 1000 watts (of course some people still rate amps on input
power so an amp with 1000 watts input would put out abt 600watts
assuming 60% efficiency). Hope this helps clear things up for you.
Remember the only stupid questions is the one you don't ask. stan/kb8jlv

Mike..
The RCS-4 is ment to be mounted outside such as on a tower to allow one feed line to feed multiple antennas.Its not intended for a shack coax switch. The internal relays are controlled by a dc voltage that is feed through the coax. Therefore nothing can be placed between the contol box and the switching unit that would short out the dc control voltage. The unit is made to handle legal power.

Last changed: September 12, 1997 |

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down,

then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. | Repair service and replacement parts for the Plectron P1 | and R700 models is offered by: *

WEBER ELECTRONICS |
PO BOX 212 |
5138 LAUREL LN |
BROAD RUN, VA 20137 |
telephone (540) 347-7760 |

You can also obtain Plectron repairs and parts from: |

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers |

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

Hello

Wanted Mobile UHF antennas (prefer permanent mount 3/4" hole mount. Ex
Maxrad M & W)
I would like to buy 5 with possibility for 5 more later.
Also wanted UHFbase station antenna or repeater antenna.
Only need one but may need another in 3 weeks.

Any e-mail welcome.
Reference to wholesale page welcome.

Stanley Koontz

Behold brothers and sisters, I bring you the profound story of how King Mackey the Great became so. It is an exciting tale filled with wonder, awe, and heroic deeds. Come closer, as I relate this grand history.

In the land of Scannerdom, the county of Power Supply was plagued with a terrible injustice. The evil mercenary force from Capacitor held the people of Smoke prisoner. Repeater, the ruler in exile of Power Supply, offered a rare and unused Radio Shack battery card to anyone who could free the people of Smoke from their Capacitor prison. A young and fearless warrior stepped forward to take up the gauntlet. Repeater told him of the dangers but the young man was undaunted and resolutely set off to free them.

When he arrived at the gate, Mackey was challenged by the fearsome guardians, Positive and Negative. So terrible were these mighty sentinels that even the renowned guardian Cerebus trembled when faced with Positive and Negative. Armed with his trusty screwdriver he didst battle with them. In the hands of a true warrior the screwdriver is no common weapon. Our hero, battle tested and proven in the labs and urinals of Technical School, was much more than a professional. He was a Grand Master of the Number Two Phillips Blade.

The guards fired spinning hex nuts and sliced with the dreaded razor sharp quartertwenty threads. Again and again, using every feint, lunge, and parry the guardians had learned in centuries of defending the cabinet, but to no avail. Mackey maneuvered himself and with one swift strike, he ended it. He had touched both guardians in the only way to kill them. He bridged the gap between them in a move only a Master Bladesman could execute, the Short.

The Capacitor force exploded from the cataclysm releasing the Smoke from their electrolytic bondage. Afterward, the Smoke rewarded Mackey with their highest honor, the Diddler of the Spark.

Mackey, hoisted by his own petard, began the journey home. In the land of Recdotradiodotscanner, he was attacked by the Legions of Ennui. These were no ordinary warriors, but elite shock troops. Armed with the latest in Apathy, Disdain, and

Contempt, they lay seige to our hero.

For months, a battle of attrition was waged. One after another, mighty warriors all, they fell. Even I, your humble scribe was a soldier in the Legion of Ennui. Alas, I too, fell before the great Mackey. No one could understand how a single man could withstand such an onslaught as we heaped upon him. Then we learned the source of his great strength. He was the most favored disciple of the malevolent gods, Fraud and Liar. They had taught him the secret fighting languages of Turpitude, Innuendo, and the most deadly of them all, Obscenity. Under their smutty tutelage, he repeatedly repeled the attacks with adroit displays of oratorical onanism.

There was a point in the war when we thought we were going to prevail. We had Mackey surrounded, he was in everybodys kill file, and his ISPs were terminating his accounts as fast as he could login. He had been beaten back to where he stood alone, armed only with a 300 baud modem and a Commodore 64.

Sadly, we all were victim to his great strategy and now he sprang his most devastating weapon. Surrounding him with our keyboards poised for the final death blow, he hoisted his hands above him. Like Moses bestowing the Ten Commandments to the chosen people, in his hands his mail-order diploma proclaming him Master of Communication Technology smote us down.

Cowered by the supreme Divinity before us, a hush fell upon the surrounding army. The only sound was a muffled cough from one of the younger soldiers. We lay prostrate on the ground before him, fearful of his wrath. Who were we to show the temerity to challenge his divine turgescence. We waited. Slowly, he walked through the defeated masses, and went home.

Upon returning to Scannerdom, he found word of his great deeds had preceded him. He was declared Supreme Grand Master Fool of the Universe and the people clamored for his ordination as King. In response, the Church of Scanner Mods proclaimed him King and the great sage and visionary Pope Bcheek presided over the coronation. As he placed the Discone Crown upon his head, he spoke the sacred papal blessing, "This boy reeks."

So there you have it, brothers and sisters. Behold the saga of his fetidness, King Mackey the Great, Ruler of Torpor, Supreme Grand Master Fool of the Universe, Grand Master of the Number Two Phillips Blade, holder of the Diddler of the Spark, Divine Master of Communication Technology, High Priest of the sect of Fraud and Liar, and Orational Master of Turpitude, Innuendo, and Obscenity.

All hail King Mackey the Great.

I would like to run mobile with an Alinco DX-70. My wife does not view a bugcatcher or a screwdriver as an item of beauty (some people have no taste!).I am considering using an Alinco EDX-2 auto tuner with an 8 foot whip. Does anyone have any experience with this combination or other solutions. Also under consideration is an outbacker. I am looking for all band operation with good performance and minimal hassles. All opinions welcome.

Thanks,
John AA2OZ

>I also second the suggestion to get the speaker/mic. I clip it on the
>shoulder strap of my safety belt and it's very convenient.

Lately I've just been clipping it on the visor, but if I'm driving for a
while
I use the earplug/lapel mic combo. It does take care of the road noise,
but the legality is a bit questionable. If the earplug (one ear only) was
plugged into a cell phone, it would be exempted from the "no headphones
on the driver" law. I think I'd win in court, so I don't worry too much
about it.

>Also, you *can* get PL-259 direct to SMA adapters if you look. I found one
>at a hamfest today.

I got one of these when I first got my FT-50R. It took me about two days
to figure out that it was defective. It had a direct short from the pin to
the
shield. I did later find a good one, but now I definately check them before
I use them.

>If you are worried about NiCd memory issues (although supposedly they are
>imagined), I run mine off the cig. lighter with no batter pack on it.

I use the FBA-15 AA pack most of the time and it's great for using the power
cord. Since it doesn't have a charge terminal, it gets almost no current
going in. I would say that it is zero, but I checked it and it is around
0.03 mA.
I hate to run the radio with no battery pack because of those power

terminals
poking out the back.

The 830 uses a voltage multiplier in the HV section and if one of the caps opens up you get 1/2 voltage. What is the actual voltage? You need to measure it across the 2 large filter caps. The one tied to ground should have 450-475 on it and the other should have 900-950.

>here.

Yes, we know they are different. But no one has suggested that people in the UK (or Australia) should change the way that they spell - please continue to spell it metres. I haven't seen anyone in the US complaining about that spelling.

On the other hand, people in the USA do spell the name of the unit of length as "meters". Surely you know that. Why can't you just let them spell it they way they spell it, without complaining about it?

I live in Canada, where people seem to be quite capable of reading either spelling and understanding the meaning.

Dave

Hello,
before this thread I had heard of three explanations for the term
HAM. This thread has had all kinds of variations on those three. What
gets me is the willingness no focus on the negative definitions, I don't
deny there are poor operators in the amateur ranks.

there is no absolute definitions of the term HAM, why worry about it?
If a none amateur asks for a definition, what's wrong with replying.
There is no verifiable answer, it's only a nick-name. IE; roughneck,
swamper and so on?

You cannot find a better unit for the price!!!

Fully-loaded with all the features and options you'll ever
need:

- Tx 144-148 and 430-450 MHz
- Rx 108-174, 400-470, AND 900-985 MHz
- TRUE dual-band!
- Simultaneous VHF/UHF receive
- 200 memory channels
- Crossband repeater mode
- Big, alpha-numeric display
- CTCSS encode and decode
- DTMF encode and decode
- CTCSS tone scan
- Wireless cloning
- 10 DTMF autodialer memories
- LOTS MORE!

So...join your local Amateur Radio Club - and find out
what you need to know about local repeaters there. And
check out that ADI-600 while they're offering $30.00
bucks OFF their already-low prices!

From: Gary Sanders <gsanders@gte.net>
Message-ID: <5vmqd0lbm3@gte2.gte.net>
Source record: 165930

Does anyone have any information on a model CSI-22
repeater tone panel, made by:

Communications Systems Incorporated.

Note that this is _NOT_ Connect Systems Inc., which
also goes by the abbreviation CSI.

It is also _NOT_ Communications Specialists, Inc.,
which is also sometimes known as CSI.

Apparently the company is out of business. The last
listed phone number, in Lynwood, WA, is disconnected.

I need connection and programming information, or
I'd be willing to pay a reasonable fee for a manual or
a copy.

Please respond via email.

Thanks,

Gary

I've had one since they first came out. It works well and is priced
right. Mine seems to be pretty much dead accurate. If its frequency
snooping you need then there are much better units but for the bench it
works well...73

In the past I have several times seen the following explanation of where "ham" is derived. In short, 3 early 1910's technicians has set up a transmitter. When the new rulings came in they asked to keep the system on the air and their initials (H.A.M.) was used to name that the users of those allocated frequencies.

5746. Computer based Radio Voice mail???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-16 00:00:00 UTC
From: vk3jma@ozemail.COM.AU
Message-ID: <1.5.4.32.19970916054402.00665a24@ozemail.com.au>
Source record: 166032

Hello,

I, for a while have had a thought that a computer based radio Voice mail system would be a very nice addition to our HAM shacks!

By that I mean, via the Mic/Speaker/PTT and Sound card connections one could use software to play and record incoming/outgoing voice message on out Ham bands (any band for that matter).

One could set up a voice mail system using DTMF_tones/CTCSS_tones etc and have a central system for a particular area giving not only personal voice mail to users but also club, geographical and local repeater info to visitors or whatever the designer wanted!

What I need to know is, is there any readily available software that could do what I am asking and if so where is it available from.

Any help appreciated.

Writing code to send Morse is not difficult I'll be glad to send you some.
It is the decoding it that presents the problem. This is referred to as a
difficult problem. As far as I know there are no algorithms that approach
what a person can do on non synchronized CW.

The only way I can think of to do it is to save the high and low states
until
you decide you have a letter and then process the states into dots and
dashes
and look up the letter in a look up table. The trick is when do you have a
complete
letter. Not real difficult if a computer is sending code but near
impossible when
a human is running his letters together a little bit.

Good Luck

>73/DX, Bill - WA4FAT

I agree with what Bill, WA4FAT says. For example our club gives the code test as straight CW and we have gotten our share of complaints from those who learned the code with Farnsworth spacing. It does make a big difference especially to those who are just learning the code. Most old timer CW operators can adjust to different spacing, sending styles etc.

Check with your VECs first and save yourself some frustrations.

5753. CARA (MD) Hamfest Announcement

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-16 00:00:00 UTC
From: "E. Allen Brown" <Al_Brown@ix.netcom.com>
Message-ID: <5vkle8$jg0@dfw-ixnews10.ix.netcom.com>
Source record: 166039

To: All Ten Meter Users
From: CBC Chapter Head, Phil Harich - N3UNF
Subject: CBC at the CARA Hamfest - Oct. 5

The Chesapeake Bay Chapter (CBC) of Ten-Ten International, Inc. has reserved a table at the Columbia Amateur Radio Association (CARA) hamfest to be held on Sunday, October 5 from 8:00 am until 3:00 pm at the Howard County Fairgrounds near West Friendship, Maryland.

We will be distributing information about CBC *and* plan to have a ten meter station set up and operating on the CBC net frequency, 28.435 MHz.

Anyone who contacts the CBC station during the hamfest will be instantly qualified to become a member of CBC. In addition, since October 5 will be Chesapeake Bay Appreciation Day, a contact with any CBC member will be worth a one time credit of 100 points for that day.

See rules posted at URL:

http://members.aol.com/Cchapter/bonuspro.htm

for details.

The Howard County Fairgrounds is located just off of Maryland I-70 at exit 80. Take exit 80 to MD Rte 32 South for 1/2 mile to the first traffic signal. Then, turn right on to MD Rte 144 West. Follow MD Rte 144 for one mile to the fairgrounds on the right. There will be ample signs directing you to the fairgrounds.

Talk-in will be on 146.52 simplex, 147.135/735 repeater, 222.32/92 repeater and, naturally, on 28.435 MHz USB.

Join us in person, if you can, or work us on ten meters.

73,
Phil N3UNF
CBC Chapter Head #FM-01

> the FCC and the code was definately farnsworth (which I found easier to
> copy).

What "specifications?" If any exist, they are not alluded to Part 97.
97.503(a) only refers to "international morse code," it does NOT get
any more specific that that. In meeting the requirements of 97.503(a),
there is nothing there that dictates the means by which this is done.
If a VE team wanted to test people by sending the characters backwards,
they could do so.
When looking at 97.503(a) and 97.509(d), the FCC is only looking for
proof of the candidate's ability to receive code by hand at the prescribed
speed. The means by which that is done is strictly up to the examining
VE's and their VEC.

I have a Motorola Maxar Mobile on 46mhz in mint condition.
Does anyone know if this radio will do 6 meters, and if so
what had to be done....Thanks

>doesn't seem to work on other bands?

I listen to a UHF repeater on 444 and have the Priority set to a VHF frequency on 144 and the Dual Watch mode works just fine. The only thing I don't like about it is that it won't check the Priority memory when the currently listened to memory is active. If I'm listening to folks chating on the UHF repeater, it won't break away to check for activity on my Priority memory until the UHF repeater shuts off and then it will start the DW cycle. I miss calls because of that. All other radios I have had with a Priority function will break away from the active channel to check the Priority channel.

I'm running firmware A105

If you're using this hardline at HF, you can easily fabricate connector adapters from copper plumbing fittings and screw-type radiator hose clamps.

There were articles in both 73 and QST in the 1980s, but the technique is obvious and at HF and VHF, the impedance mismatch is generally overcome by the decreased line loss if you have more than 50 feet of cable in the air.

I bought a 530 at a hamfest, when I got it home it had low output
on both CW and SSB. Found a cold solder joint on the base of the
6146 tube. After checking and or changing the caps, resolder all
the connections of the output driver and output tubes.

Scott
The pads serve several functions, as in most of the recent fine quality
Yaesu radios you will find that the circuit board has foil connections
on the top, center and bottom. This makes it very hard to make the mods
and then reverse them. Once the pad solder is removed you will see
sometimes as many as six connections and don't forget that there are two
more in the sandwich. It's easy to make these mods cuz you just have to
melt the solder across, however there are thousand of HT's each year
delivered to the factory in need of a new board and then rejected.
Best of luck Chris VE3NGW/W4 Florida

The VHF/UHF gear that has wide band RECEIVE capability may be
outlawed under this proposed legislation. Most current amateur gear for
2M and 440 have the ability to receive outside the ham bands, which is
frequently a big plus, especially for any ham involved with Civil
Defense/Emergency Management.
I recently used my ability to receive out of band to track a signal
which was interfering with my fire departments emergency communications.
I don't want this legislation to pass.
I would also like to mention that many police officers and
firefighters, myself included, rely on scanners in emergencies because
our departments cannot afford radios for everyone. You might consider
working against this legislation as a means of supporting your local
police and fire departments, unless your municipality is extremely
wealthy and can afford radios for every emergency worker.

QTH.Net Digests and Archives (for subscribers)
(c) 1997 k7on@qth.net All Rights Reserved Worldwide

What about Digests and Archives?

Below are examples for the 'FooBar' list. You can substitute any valid
QTH.Net list name for 'FooBar' (it is a dummy place holder).

A. Digests

All lists at QTH.Net have digests available.

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.

All list digests are configured for a size limit of 40,000 bytes.
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting

the new message in the NEXT digest.

To subscribe to a digest, subscribe to listname-digest also or instead.

If you are switching from non-digest to digest, you must unsubscribe
listname and subscribe listname-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

Here is an example for the FooBar List:

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe FooBar-digest
unsubscribe FooBar

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index FooBar-digest

and get a list of files that are available by request.

Here is an example:

>>>> index FooBar-digest
total 116
-rw-rw---- 1 majordom 45 14169 Sep 2 18:09 v01.n042
-rw-rw---- 1 majordom 45 18100 Sep 3 11:27 v01.n043
-rw-rw---- 1 majordom 45 15322 Sep 4 14:11 v01.n044
-rw-rw---- 1 majordom 45 13490 Sep 6 11:15 v01.n045
-rw-rw---- 1 majordom 45 16382 Sep 9 18:39 v01.n046
-rw-rw---- 1 majordom 45 14823 Sep 11 08:40 v01.n047
-rw-rw---- 1 majordom 45 16872 Sep 12 01:04 v01.n048

To retrieve one of these files, send an email to majordomo@qth.net.

In the body of the message, type:

get FooBar-digest v01.n048

The file will be emailed to you, automagically!

73, Brian

The ICOM Japan Brochure is unclear on the Power output on two meters.
I will assume it is 50 watts and be even more happy if it is 100 watts.
The brochure says " 100 watts 160-6 mtrs and 50 watts *100 watts on two
meters? Perhaps some country will get the 100 watt model?

Erv,
one of the best things to do is this:
Fax a copy of the bill to every news agency in your city. Fax to every TV station, Radio Station and newspaper. this bill in its current form would also limit said news agencies from gathering information "LIVE" or using said information gathered as part of a breaking news story. This goes a lot further than just amateur radio.

I also suggest that any of the rest of you that have fax machines (or faxmodems and software) do the same. the more people KNOW about this, the less likely that the bill will pass.

Hi, Ive had an FT-290 for over ten years now, until recently retired, it saw heavy mobile service,, never had a problem with it. Good RF performance.. It does have some limitations,,the 290,2M version only covers 140 - 150 MHz, but this will get you MARS/CAP,, it only has ten memories,I think(plus Call CH and 2x VFO's),,, and you can only select one CTCSS(PL) tone freq at time,, Encode/ Decode function selects can be stored in memories. Good for local FM use and for hill top VHF SSB fun

That is EXACTLY what the previous writer was complaining about ...
they want to eliminate all reception of "commercial mobile radio
services" ... and outlaw radios capable of receiving them ...

Try checking out the proposed bill ... it really IS quite onerous ...

You need to find a tester with multipin (4,6,7 pin) sockets, and
a loctal socket, too. Strange, a lot of testers, even through the
1960's usually had those.

>Any suggestions? I guess if I could find tube equivalents, I could test

There are older substituition guides that have rewiring instructions
(or you could figure them out from a tube manual), so that you could
build adapters for octal sockets. The classic RCA Receiving Tube
Manual give equivalents

5815. VX-1R - Repeater Offset

Date: 1997-09-17 00:00:00 UTC
From: markcamp@atl.mindspring.com
Message-ID: <341f250f.2165692@news.atl.mindspring.com>
Source record: 165866

I just modified my new VX-1R and everything seems to work just fine except for the Automatic Repeater Offset. I went thru the menu and it is set to on but it does not work. I have to set the offsets manually. Anyone else run into this or know how to fix it?

Brigade Quartermaster sells a neat little pager holder that is a velcro type unit. I have one and it works great with the VX-1R as a belt holder. You can snug it tight and the radio is not going anywhere. You will need to have the belt clip on the HT for this to work right tho. I think it sells for around $13.

Brigade Quartermaster in kennesaw, GA has a web site.

I suggest the ICOM 706 YOu get HF, 6 Meters, and @ Meters
all mode. What a deal. I saw one at a swap meet--used, but brand new
in the box, warrantee card and all for $850. If I had the cash I
would have bought it and had two of them. One for the house, one for
the car.

>From: "Michael Madden" <mmadden@suffollk.lib.ny.us>
>Subject: Alinco DJ-S11T Info

>Does anyone have any info on this puppy? I'm thinking of buying one. Can
it
>be modified to receive NOAA WB?

Sure can. I did it this past weekend. Works like a charm, but you
need to remove a TINY resistor. Though the following mod is for the
DJ-S41, it works just fine on the DJ-S11. RX will be approx: 137-173 MHz
(off the top of my head, don't have the radio on me now). BTW I am
forwarding what was sent to me and accept no responsibility for what you
do to your own radio.

Here's the mod:

Subject: EXPANDED RX / TX MOD FOR ALINCO DJ-S41

Performing this modification will void any warranties.
All standard disclaimers apply. This mod is for the
DJ-S41T, and not the DJ-S41(C) 10 mW version.

1. Place the radio face down on a soft towel. This avoids
scratching the display and gives you a place to put
the seven tiny screws to be removed.

2. Remove the batteries.

3. Remove the three screws on the upper rear cover, and
the four screws inside the battery compartment. The
rear cover can be lifted and removed easily, as there
are no wires to be concerned about. The antenna
connection is made by means of a gold-plated spring
contact.

4. Look for a small (about 1 mm) green surface mount
resistor (actually a 0 ohm jumper), located on the far
left side of the exposed circuit board, located to the
"northwest" of the speaker. There is a marking in white
letters, OP/CL, this resistor is over the top of the "P".
It is the only green component visible on the board.
(This radio does not have the traditional Alinco red
and blue wires which have become so familiar...)

5. Carefully remove this resistor, using a small tip soldering
iron, tweezers and a steady hand.

6. Re-assemble the radio, being careful that the thin rubber gasket is seated around the inside edge of the rear cover. Replace the batteries, press and hold the "F" button on the left side of the radio, and turn it on. The display should show all segments and markings. Release the "F" button and the radio will now be capable of operating from approximately 425 MHz to above 470 MHz, depending on the VCO's tuning. The display will blink if the VCO is taken out of its range. Re-tweeking of the VCO is not recommended.

Source record: 165876

I gather your looking for all mode? I think the last would be the module for Yaesu 736. Even FM stuff is tough to come by: Kenwood (last I checked) still made a monoband FM mobile and the 642/742 multi-bands, but I think that's about it. Standard?

Does anyone else know of anything?

Message-ID: <19970917055001.BAA12762@ladder02.news.aol.com>
Source record: 165883

Gentlemen,
Recently I aquired 6 Motorola hand held UHF Business Radios which are factory new in the boxes. With the intent of using them on the US amateur bands.
Make: Motorola MT-2100 Model: H01RDD9AN5A w/Digital display
These radios exactly resemble the US version MT2000.
After consulting with my local Motorola dealership, I discovered that these models are for European use and the software for programming them is only common to Europe and not the USA.
I need to find a radio dealership,business, or private party who is interested in purchasing these units for a discounted price.
Also, I am interested in obtaining the software so that I can use these radios on the amateur bands.
(Hope some of you guys in Europe read this and help me out)
Thanks & 73's

5834. Instructions For Kenwood TR-2600A

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-17 00:00:00 UTC
From: marty@trucom.com
Message-ID: <5vnriq$5kh@thepit.trucom.com>
Source record: 165885
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hello:

I just received a Kenwood TR-2600A 2m HT to use while my illness makes me unable to leave the house, but while the rig is in very good shape and works perfectly and has just about all the goodies that one can get, it is missing the manual.

I am hoping that someone could send me some basic instructions on how to work the thing! Things like how to access the memories, how to set the PL, how to change frequency, how to set the offset, stuff like that... Just day to day operations.

What-ever folks think that might be of use. I found ArtSci's site with the replacement manuals, but who has the $20 + shipping that they want! Not me.

An E-Mail reply would probably be best since there isn't much use in taking up more group bandwidth and my ISP's news server is notorious for never getting articles. :)

Many thanks!

Take Care & 73

Amateur Radio Shareware Collection Available

I once collected and cataloged shareware available on the
Internet and came up with a compressed (zip) collection of
programs and information in about 25 or so categories.

Below are listed directories in which this material was divided,
each containing about 1Mb (compressed) of materials.

Being compressed (zip) this is a substantial collection and it
is now available all in one place.

You should be able to access this through your web browser and
I have included a link on my home page (near the bottom):
http://www.qsl.net/k7on/index.htm

Hopefully, there is something of use to about everyone in there.

I have like new an MFJ-1270CQ, comes with factory installed 9600bd modem, works either @1200bd or 9600bd, manuals, cable for radio, and powersupply...Original box, and in mint condition, with no scratches...Purchased for $200.00 plus tax, for a Node site, that did not work out, I am asking $175.00 plus shipping...
If you are interested, please send E-MAIL too larrysh@itis.com

Thanks de Larry/WD9ESU

5842. Re: Icom IC2340H dual inband rx?

>gregg@plains.nodak.edu
>(-------------------------------------)
The 2340 can not do a VHF / VHF operation. The IC-2700 and IC-2710
can do the dual in band receive VHF / VHF or UHF / UHF.

There is a small circuit board that connects the keyboard to the logic
board. These boards are connected using fillet solder joints. likely
one of the solder joints is cracked. You will need to remove both
boards from the case front and solder these fillet joints then
reassemble the boards back into the radio front.

> INRAD filter company?

INRAD filter company only sells the Drop In 400HZ CW filter. They have
not come out with a Drop IN "AM" filter or a narrow SSB filter.
The problem for the Narrow SSB filter is the FT-920 won't allow you to
use the "narrow" button while in the SSB mod. You could try to replace
the Soldered-in SSB filter but then your TX audio would be tinny and
you would have the 2.1 KHZ filter in line all the time. Also I heard
the soldering is very close to some sensitive surfacemount components.

I am a technical writer. In the daily course of my job,
i encounter "features" such as this that I am requested
or required to hide from end users.

Just because the manual says one thing or another does not mean
that the manual is either complete or correct. And you know that
RS won't document a method to give out-of-band capability.

For what it's worth, my venerable old Azden PCS-6000 can be modified
to provide out-of-band coverage. Disassembly to perform the
mod -- guess what -- blanks out the memories, requiring complete
reprogramming. Naturally, this capability is not documented, but
for that matter, neither was channel programming.

Reprogramming the memories is a small price to pay for extended
frequency coverage, especially if you can do the mod from the keypad
withou having to touch a screwdriver.

Many rigs do very well with
the single 2.1 KHz filter in line with TX audio, depending on where
the carrier setpoints are placed. Most receivers can't tell the
difference between the 2.1 and 2.4 filters very readily, it takes
a fairly wide receive filter to give your ears a chance to detect
small differences in those SSB bandwidths. I used to use a 2.1
KHz filter in the TX line with my Kenwood 440 and often got better
audio reports than other rigs with standard 2.4 KHz filters, and
I suspect it was the carrier setpoints that made the difference.
So, for the limited filter choices of the FT 920, a single 2.1 KHz
SSB filter may just be a good ticket, if you are willing to go in
there and set things just right. It sure does make a difference on
receive QRM and noise.

It wasn't you who started this thread - my comments were aimed at him.

We all know that the metric unit of length is spelled metre in some countries and meter in others. Wouldn't you find it rather tedious if, every time someone in the UK or AUS used "metre", someone in the US posted a "correction" pointing out that they spell it differently?

Yet it seems that every time someone in the USA posts about a "two meter" radio, some twit *has* to post an article pointing out that "meter" is not a unit of length for them. It was even a bit funny the first one or two times, but it really isn't any more.

I am confused- what do scanners have to do with classical amateur radio-
which got along just fine before this relatively recently introduced
device came on the market.
I am not sure what is meant by wide-banded ham gear, but if this is
just the stuff well suited to transmission OUTSIDE the legally assigned
ham-bands, I can't see why a real ham cares. This is stuff for the CB
"free-banders", pirates operating in the short-wave bands and the like.
It is also the stuff which makes enemies for the ham community.
I would object if reception is limited to only ham frequencies.

Bob

PS I have trouble with terms like "serious Damage" and "vicious pack of
poison" if the above interpretations are correct.

Hi Bob, maybe a specific question will shed some light. Will this bill
make my general coverage IC-706 illegal? Out of the box, it will
legally receive portable phones around 47MHz if I remember correctly.

The initial calibration of the Radio Shack counters seems quite accurate.
I've checked two of them against a GPS-based timing reference, and both
seemed to be within about 1 PPM. They don't drift much either, since
they run quite cool. They seem to be more accurate and stable than
a couple of bench frequency counters costing several times as much as
the RS ones.

Of course, the RS counters are good for RF only, while the bench counters
cover a much wider frequency range. And the maximum resolution of the
RS counter is 100 Hz for the least significant digit, so you can't even
measure frequencies under 100 MHz to 1 PPM resolution. For checking VHF
and UHF transmitter or VCO frequencies, it's great.

Source record: 165714

I am holding off on my opinion of the HT-600. I purchased mine a couple of weeks ago and have had to send it back to the factory for the following reasons:

-- PL does not work on all frequencies. 131.8 seems to work 173.8 does not.
-- When the PL does work it is VERY slow. Sometimes takes nearly a second to open. This results in the first word(s) of the conversation being clipped off.
-- Receive and transmit range is no where near as good as the Yaesu FT-50 and FT-51s I have had. I can barely hold up our local UHF repeater from the same location that my Yaesu FT-50 gets in full quieting.
-- Some accessories (software) are not available yet or in short supply 12VDC cord.

I hope the factory can restore my confidence in the unit. It does have some nice features but if the basic performance is not there I guess I loose.

I concurr that it is there. It is very tiny though. Never had any need
to change it's position.

On the subject of FT-757 GXII mods, has anyone seen the mod to expand
the display to 10HZ display? I had it several years ago and lost it. A
DejaNews search doesn't turn up anything.

TIA,

Robert, N2JTX

5869. Linux/Unix Kenwood computer control program

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-18 00:00:00 UTC
From: Jeff Pierce <piercej@preferred.com>
Message-ID: <34215A28.5E79@preferred.com>
Source record: 165720

Kenwood TS-140/440/940 amateur radio transciever control program for Linux (Unix) systems is available from:

http://www.preferred.com/~piercej

This program utilizes the xforms library that is available for many different Unicies including Linux, FreeBSD386, Solaris, etc. Xforms is available from:

http://bragg.phys.uwm.edu/xforms

I am distrbuting linux binary form and SOURCE code so it can recompiled for your flavor of Unix. It only requires the above xforms library.

My program presents the user with a reaonable likeness of a Kenwood radio faceplate complete with frequency display, vfo selection, mode selection, split operation and RIT control. Limited radio memory usage is in this version.

Checkout my above homepage for a complete fucntionality listing and a graphic of the front panel controls.

It has only been tested on a TS-140 as that is what I have. However, it should work with the 140 & 940 as their copmputer commands are a superset of the 140.

Check it out.

Jeff Pierce, wd4nmq

I am interested in packet radio, too. Here in Germany some advertisements say, that due to DIREKT MODULATION you can use the FT50 with G3RUH too. Noone could verify though. Is it possible at all? Without mods?

>Thanks, John N3YRX

I've used the VC-23 on occation and it works pretty well. I've found that for use involving much movement, I'm better off with just a speaker mike. I was using my '50 with a chest harness, the speaker mike and earphone under my helmet for skiing and it seems to be the best for that type of activity.

Hope this helps Ned N1IRS

From: Alexm <alexm@nyct.net>
Message-ID: <EGpxsI.8vn@nonexistent.com>
Source record: 165733

We're setting up a small FM stereo station (10-100 watts)in the mountains of rural Colorado. We're starting from scratch, so we'll need everything from transmitter to mixer to antenna.

We're electronics neophytes, and though we're willing to learn and study, we'd like to purchase a system that's as close to plug-and-play as possible. Can anyone recommend a plug-and-play FM stereo transmitter system, or can we purchase an already assembled kit from you or someone you know? (We've checked out a Ramsey system which allegedly includes everything. But at 1 watt, it seems a bit underpowered. We've also looked at 12 and 45-100 watt systems sold by R. Scott Communications in Canada. Any experience with their stuff?)

Any help would be appreciated!

SPECIAL OFFER - SMA AND TYPE N CONNECTORS

We have just acquired a large number of these brand new connectors.
If you can use these, please contact us ASAP. Once they're sold, we
won't have any more for another 4-6 weeks. Here they are:

TYPE N, Quantity 2,000 each Male and Female

Nickel Plated Brass, Mil-C-39012 interface,
BeCu/Au plated contacts
Square flange .690 X .690 inches
Mounting holes 0.5" on center from each other - square
Stripline tab on back - 0.50 wide X .005 thick X 0.10 long
Captivated contacts.

Quantity Price each FOB Dayton OH
25-99 $5.50
100-499 $4.95
500-999 $4.50
1000-2000 $3.75

SMA Quantity 1500 each Male and Female

Male: Silver-plated body, BeCu/Au plated contacts
PTFE dielectric
Flange 0.50 square, 4 ea 0.102 dia holes
Mil-C-39012 interface
Epoxy filled cross hole captivation
Tab width 0.050, length 0.100, thickness .005 inches

Female: Passivated stainless steel, BeCu/Au plated contacts
PTFE dielectric
Flange 0.500 square, 4 ea 0.102 dia holes
Mil-C-39012 interface
Epoxy filled cross hole captivation
Tab 0.050 wide X 0.100 long X 0.005 thick

Quantity Price each FOB Dayton OH
25-99 $4.00
100-499 $3.25
500-999 $3.05
1000-1500 $2.50

VISA and MasterCard accepted.

We can get top quality connectors in quantity at lower prices than
almost anyone else on the planet. Send us your requirement and let

us show you. For example, we recently showed Lucent Technologies a savings of 25% over their previous supplier, and have done the same for other large companies.

All types of RF connectors are available. We can even meet the FCC requirements for spread spectrum specialty connectors. We can plate them the way you want, including tri-plating.

5892. Re: MFJ 9030 CW has bad buzz on xmit

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-18 00:00:00 UTC
From: k1bqt@aol.com
Message-ID: <19970918221901.SAA16672@ladder02.news.aol.com>
Source record: 165743

Hi Tom--

The bulk of the "ripple" control in the 9030 is done electronically with the voltage regulator. The first thing I'd check is the voltage-regulator output voltage vs. supply voltage. If you don't have a good 1.5 V of difference between the two, you may have to reduce the regulator voltage below 10 V. Usually, if the regulator voltage is low, it may show up as motorboating in the receiver at high volume. Crank it up and see what happens. If that doesn't fix it, E-mail me and let me know. Hopefully, we'll be able to work it out.

==========
I purchased a VC-23 and I cannot get the VOX to work. It works fine with the remote push to talk button, however. Since I really didn't want VOX, but was really looking for a push to talk headset, it works fine for my purposes.

From: tjff@lanl.gov
Message-ID: <tjff-1809971346310001@mamie.lanl.gov>
Source record: 165746

All,

After several years of reliable service, my 9030 has developed a bad buzz on transmit. The power supply seems fine. The board looks OK. I remember reading on this group about someone else having this problem and the fix was simple, as in replacing a capacitor. Any assisstance would be most appreciated.

Tom

>choice?

Yes, the VC-23 is a good choice. I have had mine for more than a year
and use it daily. The VOX feature works very well. I use mine about
80% with the PTT button and about 20% with the VOX (typically because
I wear my radio on my belt around the house while doing chores and
don't want the vaccuum cleaner tripping the repeater via my VOX).

5898. Re: Realistic HTX-202 mod

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-18 00:00:00 UTC
From: KD1YV <jimkd1yv@eat_spam.and_die.snet.net>
Message-ID: <3421C382.6FD@eat_spam.and_die.snet.net>
Source record: 165749

There _is_ at least one undocumented feature on the HTX-202 (the handi.) It goes like this:

If you like to scan memory channels, or priority channels, but occasionally want to block out one or more from the scan list, simply tune to that memory channel and press the F/M-CLR keys. This will cause the display to show a blank memory and that channel will be skipped when scanning. However, the information is not erased from the memory (as the manual would have you think.)

To restore that memory or priority to its original settings, simply tune to that memory and again press the F/M-CLR keys. It will be restored automagically.

It should be noted that to scan either the memory or priority, you must have at least 2 active memory channels programmed (but of course, that just makes sense, doesn't it.)

Hey,
I've got a Sony CD player AM/FM radio and I get rotten FM reception.
There are no external FM (or AM) screws for me to hook in an external
antenna. I was going to put the cable from the cable TV into the antenna
jacks...but there aren't any means of connecting it to the radio.
Can I solder leads onto the telescoping antenna then attach the Cable TV
/FM reception cable to those wires?
Is the telescoping antenna for FM . . .or AM??

Thanks

Herr Mueller:

The US Congress has two bills in front that would ban the manufacturing and use and scanning receivers to include amateur equipment. Law enforcement, news media, everyone, no one would be exempt. Because of the pressure from large businesses such as Motorola, this hints of fascism. Things are not going well here. I wish that I was back in Kaiserslautern.

Doing the mod essentially tells the radio to ignore the bandplan,
which allows it to go out of band. However, the bandplan contains the
ARS and step size data as well, so it will kill the ARS (just like the
FT50)

Drake started to cut corners about the time they designed and built the L7.
In my opinion, the quality of the L7 doesn't come close to that of the L4B.

While an L4B won't tune 30 and 160M, 12M and 17M do work just fine!

5921. Re: Which 2M mobile runs cool at 50W and above?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-18 00:00:00 UTC
From: nospamdtse@inorbit.com
Message-ID: <5vqdsv$479$1@news.bc>
Source record: 165813

I used to have an Yaesu FT-2500M. It ran too hot on 50W after a while, so hot that it degraded the receiver (signal level on received signal) gradually, until the signal is gone. When the radio cooled down a bit, then it worked fine. I was foolish enough to let a guy replace the transnit PA IC, to a Toshiba SAV-7 (diff. brand and model from the original, but works). It was still very hot. I asked the guy and he blamed it on the oscillator. (I knew better than that.) I have not figured out exactly why, and not bothered to add a fan on.

Well, with so many satisfied users, I might be the fewer ones who have trouble. Your mileage may vary. (although I have heard same on this gorup here.)

Not too many people put out all 50W and ragchew on it for a long time like me though. Most run low power to a repeater and never found out the degree of heat.

5924. Engine Noise

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-18 00:00:00 UTC
From: Allan Merzer <amerzer@stlrcga.org>
Message-ID: <342176F6.4BD09CE1@stlrcga.org>
Source record: 165816

I installed a Kenwood TM-261A in my Jeep. I am using the enclosed power cable with 20amp fuses on the pos and negative lines, with a cig lighter adapter that has its own 20amp fuse.
The Kenwood cable has a 15amp fuse in it. Everythng works just fine, but,
I frequently get engine noise static when I accelerate and deccelerate. Would the Kenwood DC line noise filter between my power cable and cig lighter adapter get rid of this noise, or do I need someting else?
Thanks in advance for your help,
Al

Hello all,

I am looking for an _affordable_ 2M all-mode (SSB-CW-FM). I used to
have an Icom IC290H that I would like to find again. Please, no dual
band satellite radios, I can't afford one, yet!

Please email me at: k3tz@nauticom.net

Also, would you consider a trade for a mint condition Icom IC281H?

Thanks for reading & 73,
Tim

Ranger has been known to be a radio that tallks well on the frequency you are talking on but also is heard on many others at the same time. A dirty radio. Iv' heard favorable comments on the 2510 Uniden but I don't think they are available any longer. A 570 Kenwood would be an excellent radio as a portable or base radio.

QTH.Net Digests and Archives (for subscribers)
k7on@qth.net

What about Digests and Archives?

Below are examples for the 'FooBar' list. You can substitute any valid
QTH.Net list name for 'FooBar' (it is a dummy place holder).

A. Digests

All lists at QTH.Net have digests available.

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.

All list digests are configured for a size limit of 40,000 bytes.
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.

To subscribe to a digest, subscribe to listname-digest also or instead.

If you are switching from non-digest to digest, you must unsubscribe
listname and subscribe listname-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

Here is an example for the FooBar List:

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe FooBar-digest
unsubscribe FooBar

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index FooBar-digest

and get a list of files that are available by request.

Here is an example:

>>>> index FooBar-digest
total 116
-rw-rw---- 1 majordom 45 14169 Sep 2 18:09 v01.n042
-rw-rw---- 1 majordom 45 18100 Sep 3 11:27 v01.n043
-rw-rw---- 1 majordom 45 15322 Sep 4 14:11 v01.n044

```
-rw-rw---- 1 majordom 45 13490 Sep 6 11:15 v01.n045
-rw-rw---- 1 majordom 45 16382 Sep 9 18:39 v01.n046
-rw-rw---- 1 majordom 45 14823 Sep 11 08:40 v01.n047
-rw-rw---- 1 majordom 45 16872 Sep 12 01:04 v01.n048

To retrieve one of these files, send an email to majordomo@qth.net.

In the body of the message, type:

get FooBar-digest v01.n048

The file will be emailed to you, automagically!

-----
```

Anyone have a status on the software Icom demod at Dayton this year? At the time they said it would be available in June on their web page, free. I've called them several times and I just get put off. It was written for Icom by an independent software writer as I was told. Anyone know who it is and if they can be contacted?

I have the interface hardware for my 706 MKII and it is a bit pricey and quite worthless without software.

You can by the Yaesu CA-15 charging stand which will allow you to slow-charge the radio as you are using it. About $30. However, if you have the $$$, by a rapid charger. Yaesu sells a charger will lets you charge 2 batteries at once, or one battery for different radios (uses battery cups to charge different voltages/sizes)... However, MAHA sells a $70 rapid charger for the FT-50 only which can charge an FNB-41 from dead to full in about 30-40 minutes. You can't charge two at once, but at that speed, it's really not necessary.

Try on of the Comet SMA-3s... I have an FT-50 and it works like a charm on it. However, the antenna is stiffer than the FT-50 stock, which is stiffer than the VX-1, along with being 10 inches. I believe the gain is 1.7dB on VHF and 3.4 on UHF... Anyway, so much for that itty-bitty size, huh? If you want something tiny, get the SMA-BNC adaptor from Yaesu and use a Miracle Baby from Comet on it. BEWARE: The SMA antenna which is proclaimed to be the Miracle Baby is NOT. This antenna is worse than a dummy load (some reports of -33dB below unity gain). As long as you are careful with it, you won't break it off the top of the radio. Also, the SMA of the Yaesu requires a longer internal pin. Some adaptors have a shorter pin and will cause undesired operation, as well as possibly higher SWR. The connector itself is really RF Industries part number RSA-3458 (I spent the $9 to find the RF Ind. part number printed right on the adaptor.) Some people have reported that some of the Diamond antennas have shorter pins and MAY not work with the radios... Make sure you can return it, and if possible, play with the antenna at the store before you buy it.

Anyway, I hope the information helps...

5941. Illegal Operations on Two Meters

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-19 00:00:00 UTC
From: robert333@houston.email.NET
Message-ID: <9709190154.S1605822184@houston.email.net>
Source record: 165675

For some time now, I have noticed a certain user who plays music, falsely indentifies his station, plays music and sound effects, interferes with communications in progress, and otherwise is disruptive and abusive. This individual seems to be camped on the 145.47 repeater on the Southwest Memorial Hospital.

I have had discussions with the regulars on this repeater numerous times about this problem, and their attitude seems to be to ignore the problem. They have told me that it has been going on for five years now. Something seems out-of-place here, though. If they have elected to employ apathy, but the problem has continued for five years, it would seem to me that their approach isn't working.

Since communications are being retransmitted through this repeater, and the users don't seem to want to do anything about it, can the trustee of the machine be held liable for allowing this abuse to continue, under carriage of his call?

Any help would be appreciated.

Hi to all, I'm looking to trade a Kenwood TH-78A for an Alinco DJ-580T or a DJ-582 which is in good looking and excellent working order.
The Kenwood comes with one 12 volt 800ma battery and a 7.2 volt at 800ma. These batteries are just about a year old and are in excellent condition. The radio is an 8 out of 10 in apperance and in excellent working condition. NO CHARGER, but have a W&W charging cup.
The manual is also included.
Thanks, Mark N2FLF

*****NOTE***** To reply, please remove the NO.JUNKMAIL from my address.

I believe it has a second time zone. Use the mode switch.

I have the German model (both are made by Oregon Scientific). It does have the mode which allowes a second time zone.

Interesting comment. Is it difficult to get into school in the UK? If so, why? Too few seats for too many applicants? Entry requirements too tough (perhaps because of too few seats)?

Dont bother with the cable from cable TV, there are thousands of
frequencys on that line and will more than likely provide you with more
noise and interferance. Get a test clip and connect 50ft or so of wire.
That should improve things. If you want a more elaborate FM antenna,
email me. Put the wire outside if you can for enhanced J. Geils
reception.

> Dick Flanagan W6OLD CFII Minden, Nevada (South of Reno)

While I don't disagree with this comment, I have (had) both and the L7 is not so corner cut as to make it undesireable IF you want 160M. I would say that the L7 is better than the Ameritron, etc. The L7 does not use chimneys for the tube cooling but instead blows air crossway on the tubes (and does pull air through the tube pin areas). Seems to work fine. I miss seeing the glow of the tubes, however.
By the way, a friend of mine put 160M in an L4B using vacuum relays and a toroid so that there were no holes drilled, etc. He used the switch on the alc to activate 160M. It can be made stock again if desired. Works fine.

Chuck.

The ANC-4 is particularly good at cancelling line noise.
Random noise like distant storms, it doesn't handle so well.
Local line noise is eliminated.

The telescoping antenna is for FM. There are a couple of ways to couple to this. The simplest way is to loosely wrap a few turns of insulated wire around the rod and solder the ends of the wire to the inner and outer conductors of the cable. A more sophisticated method is to use a L network between the cable and the rod/chassis. The easy method will probably suffice, however.

No, it involves changing one of the PIN diodes in the 2m TR switch
to a heavier diode. The problem is that HF energy can be coupled
back into the 2m side if the antennas are close together. The original
PIN diode can only handle 10 watts, not the 100 watts from the HF
side. Icom will do the mod for you, or you can get the diode from
them and do it yourself.

On Wed, 17 Sep 1997 18:03:13 -0500, "David G. Nagel" <nagel1@mail.icongrp.com>
wrote:
>Before we Americans get to smug about our accomplishments don't forget that
>radar (microwave ovens), control grids (in tubes) and computers (the Babbage
>Engine) all came from England. Not Silicon Valley...

Well, England was an early leader in applying radar to warfare, but the
Japanese had the magnetron first, though they didn't quite know how to
employ it properly then. They obviously do now, because they've taken
the microwave oven market away from its inventor, Litton (a US company),
and made it their own franchise, as they have TV sets.

But back to our history, the very first radar set was produced by two
Americans, Breit and Tuve, in 1925. That was 10 years before
R. A. Watson-Watt (a Scot, don't give the English too much credit)
had a working radar in the British Isles.

(These early sets didn't use the magnetron. They operated on lower
frequencies. The 40 station radar chain used by England in the Battle
of Britain operated at low UHF. Some radars still do. PAVE PAWS
early warning radars operate at 70 cm for example, and don't employ
magnetrons.)

And while Fleming's valve was the first practical vacuum tube diode
(based on the Edison effect, IE a US discovery made two decades
earlier), it was the USA's own Lee De Forest who first added (and
patented) the control grid for his audion tube. But it took the work
of another American, Harold Arnold, to make it a practical amplifier.
(Arnold developed the way to get an extremely high vacuum in the
tube, IE the getter.) It was a German, Walter Schottky, who added
another grid, creating the tetrode, and a Dutchman, Benjamin Tellegen,
who added yet another, creating the pentode.

Babbage had the theory down pat for the stored program computer,
but he never got his Difference Engine to run. The first functional
stored program electronic computer was produced by the US military
(ENIAC). And while Lady Ada is credited as the first computer
programmer, her computer didn't run. But Grace Hopper's did.

(Meanwhile, the most beautiful woman in the world, Heddy Lamarr,
was out in Hollywood inventing Spread Spectrum.)

Of course Silicon Valley was still undeveloped farm land during this
time. It didn't start to go high tech until Ampex located there in the
early 50s to make the first audio and video tape machines (the idea
for recording tape was pirated from the Germans). Engineers from

that company spun off numerous other high tech companies in the area. Hewlett and Packard started another company anchoring the southern end of the valley, and spinoffs from their company spawned many more high tech companies. It didn't become Silicon Valley, however, until National Semiconductor opened up. The spinoffs from that company put the Silicon in the Valley.

>
>Thanks!! Jim, WA1GPO

Jim,

Try the Vertex (Yeasu) CA-15. It is a stand up base that you connect
the FT-50's wall charger into. It will take the FNB-40, 41, 42
batteries by themselves so you can continue using the radio with
another battery.

I have also heard that back in the "Good 'ol Days", old lane line
telegraph operators refered to the code skill of hearly Hams by saying they
where "Ham fisted" / sloppy. It was ment as an insult, like the song
"Yankee Doodle Dandy" was.

I understand Canada too has been blessed with the cash registers that figure out the prices, compute the tax, and then figure out the change. If you haven't already - you will soon find most of your stores absolutely unable to operate during any power failure or other case of "the computer is down".

One that you may not have seen yet is a new computerized cash register recently put into service with one of our major discount gasoline station chains (Thorton's for anyone interested). This cash register gets the gas prices directly from the computer-controlled pumps, and all other prices by scanning the UPC bar code. The only thing the operator has to key in is the amount of money the person gives to pay for whatever they are buying -- and, of course, the cash register figures out the right amount of change. So far, so good, sounds pretty normal. Ah, but this system goes two steps further. This system has about a 9" computer monitor screen on it. It not only figures out the amount of change, it figures out how to make that much change (how many of each denomination) and DRAWS A PICTURE OF THE CASH DRAWER SHOWING HOW MANY BILLS OR COINS TO TAKE OUT OF EACH SLOT IN THE DRAWER!

Unfortunately it does not maintain an inventory of the drawer (I'll bet that comes soon). One day I gave the clerk a twenty dollar bill for some purchase under $10. The picture showed that the clerk was supposed to give me one ten dollar bill as part of my change. The drawer was all out of ten dollar bills. The clerk had to call the manager to figure out what to do!

> Babbage had the theory down pat for the stored program computer,
> but he never got his Difference Engine to run.

A working Difference Engine was eventually built, but not by Babbage.

> The first functional stored program electronic computer was produced by the US military
> (ENIAC).

ENIAC was not a stored program computer; it was "programmed" by changing
patch cords and setting parameter knobs. The first electronic stored
program computer was the Manchester Mark I, built in Manchester England.
See http://www.cs.man.ac.uk/mark1 for details.

There is no greater admirer of Grace Hopper than I, but she was not the
first programmer by a long shot. Her great contribution was the
invention of the high level language and compiler.

Message-ID: <601ah0$gds@bgtnsc03.worldnet.att.net>
Source record: 165615

My Kenwood TS-440S tranceiver has been working just fine until today. Now it will not transmit on any frequency between 10.500Mhz and 22.000Mhz. It transmits just fine on other frequencies. But between those frequencies, if I push the PTT or turn on the automatic antenna tuner, after about one second the transmit LED goes off and the receiver comes back on.

Does anybody have any ideas about what might be wrong?

Chuck

CatScan provides computer control for the Yaesu FT890 (and similar) transceivers. It complements the facilities found on the radio, and adapts the radio better to a radio facsimile monitoring environment.

*** It provides a simple way to use a Station database, and to browse the bands selectively.

*** It has Advanced scanning facilities, to help you find the best signal on the bands.

*** It has Short-cuts to otherwise awkward functions, such as Direct frequency key-in, Write memories to radio and Side-band/filter toggle.

*** It has a Command line interface so that scripts can be used to control the radio from within other programs.

It is free, and available for downloading at:
http://www.geocities.com/SiliconValley/2504/catscan.htm

73's from Brian.

>get the Timewave, or hey, the IC-745, maybe the 756.... Decisions
>decisions....
>

The number of IF's and AF vs. IF DSP are good technical points but the important item is how it all works together in the real world. I've had an FT-920 for about 10 days now and it plays well. The FT-920 replaced a venerable Kenwood TS-930 (quadruple conversion and DS-what?). The receiver in the FT-920 equals or exceeds the performance of the TS-930. On SSB the DSP cut works better than the slope tuning on the Kenwood. The 500 Hz filtering and/or the DSP have produced some satisfactory RTTY DX. Not being much of a CW op I had a friend (35+ wpm type fellow) over for a spin and he felt the QSK was quite good.

Everything's a matter of opinion. I wouldn't mind having an FT-900 or similar portable radio as a backup or travel rig but it's too small for my taste in base stations. The large panel and display of the 920 coupled with a reasonable number of features knob/switch-controlable from the front panel makes for good ergonomics. All in all I'm satisfied with the performance and it packs a lot of bang for the buck.

Its basically just like an SB 220, with 2@ 3-500Zs and about 11-1200 watts out. This one looks nice, much better than a Heathkit. Made in the 70s , it was a kit just like the 220. Appears to be well made and all is operational. Will ship it (if you insist) for $550. Has 10-80 meters and is a bit more heavy duty the the Heath 220 as well. Thanks, Murray Neece Odessa, Texas WILL TRADE

6003. Announcing DFD2 (Digital Frequency Display)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-20 00:00:00 UTC
From: neil <aade@ix.netcom.com>
Message-ID: <34243C2C.7051@ix.netcom.com>
Source record: 165626

Announcing DFD2 (Digital Frequency Display)

DFD2 is designed to provide a digital frequency readout for the type radio that consists
of a bandswitched crystal controlled (or PLL) converter in front of a tunable IF.
Notable examples are most of the Collins equipment, the Yaesu FT-101, the Kenwood
TS-520 and the Heath SB-301. This type design was very common in the 50's, 60's and 70's.

DFD2 displays absolute accuracy of the carrier frequency for all modes (AM, CW, USB, LSB)
by measuring the HFO (crystal oscillator), VFO (tunable oscillator) and optionally the BFO
(Beat frequency oscillator). Because DFD2 measures all frequencies the accuracy is only
dependent on DFD2's reference oscillator which you can set.

The radio typically has to be slightly modified to bring out these signals. Exceptions are the
Collins 75S-1 and Heath SB-301 which have these signals available on the rear panel. DFD2
is essentially plug-and-play for these two units.

There is a general purpose DFD2 with adjustable IF offset. It provides 100Hz resolution.When
measuring the BFO, DFD2 automatically displays the mode of operation (blank, CW, USB, LSB).
The 'blank' allows for not connecting to the BFO in which case it uses the programmed IF offset.
The display does not show the exact carrier frequency if the BFO is not measured.

Custom microcontrollers are available programmed for the Collins, FT-101, TS-520 and SB-301.
The custom units have jumper programmable resolution of either 100Hz or 10Hz. When measuring
the BFO, DFD2 automatically displays the mode of operation (AM, CW, USB, LSB).

If you have a unit of this general design for which a custom microcontroller is not listed, send
e-mail or call and we can work togather to develop one for your type radio.

Hello all, my local rptr club is looking to get info on going synth with their radios, wondering who's using something like a Motorola Radius mobile for repeater operation, how much would a 2 ch. radius mobile cost on the used/new market and feedback on how the radios work for you, intermod problems, etc. We're going to do some linking and would like the ability to move the radios from one machine to another without having to re-crystal. Advice? comments?
Thanks!

Fer sure, fer sure. Hell, HAM is the very best part of a pig. The
rest is just PORK. I cleaned out hog houses when I was a kid and I
guarantee, I HATE PIG. Pigs, especially sows, are mean and very
dangerous. Boars are, ... well.... boars. I do eat ham and bacon
(Note, both are smoked) but the rest, fergit it.

6033. Need info. on 6 & 2 meter antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-20 00:00:00 UTC
From: don von hagel <w3hyw@digizen.net>
Message-ID: <01bcc579$ba2c2060$27315bcc@w3hyw.digizen.net>
Source record: 165688

Some time ago I posted to the antenna group and didn't get the information
I needed so thought I would try this group.
I bought a 6 & 2 meter beam at a hamfest and the guy I bought it from
called it a stinger. He, unfortunately, didn't have any other info on it.
It is a 10 element yagi on a square boom. some of the elements seem to do
double duty on both bands. I need to know in what order the elements are
to be mounted on the boom and how to feed the 2 meter driven element. Has
anyone heard of this antenna and can give me any info on it?
Anything would be a help. Thanks.

Next time you post a 144Mhz radio for sale and you want to use the ham terminology,
Type it like this 2m radio forsale. That way, the darned Britz won't post sucha stupid message.

6036. Yaesu ft-50r help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-20 00:00:00 UTC
From: ah <ah@sparky.mofo.net>
Message-ID: <5vvsu5$epv@bgtnsc03.worldnet.att.net>
Source record: 165691

Ok here's the deal,
i did the mars/cap mod to probblem.
I then decided to proform this computer
interface mod.
I saved a template file with the
orginal stuff. then while coping the
template (not the *.rdf file) i pulled
the cord out at about 50 %.
i can't load the orinal template file
unless i unclick the 'load template file'
box, and after loading it, the ht stays the
same. if i load the file with the box
checked i get 'cerr.'
i tried many things mainly loading old,
new, and both *.rdf files (now this was
after i loaded the 50% template file)

i turn on the ht, reset it, etc
all i get is mainly a blank screen

i can get a 'ALRST prS F' msg if i
reset the ht.

Now the whole ht is messed up ;(
leaving me very sad ;(
I think i'll just sit here and cry :(

Hi Guys and Gals !

I've done it again!
Huge MFJ blowout sale !!
If you don't go you won't know!

If you don't get it now you'll definately kick yourself later!
Go to my web page, you'll see the link.

Check my pages OFTEN, I've got TONS of other stuff to list.

>resetting, etc. Fried finals? It's only 2.5 years old and hasn't been
>abused. Seems to transmit OK on those bands. Scott.
>sdspence@ix.netcom.com AB5YD.

The product detector output is hosed. It uses a product detector for USB,
LSB, and CW. It uses an envelope detector for AM and a discriminator for
FM. Since those latter modes work, everything in the radio except the product
detector must be working.

The faint hiss you hear is just the noise generated by the audio amplifiers.
Since the rig transmits in SSB and CW, the oscillators must be working,
and the IF stages (bilateral) must be Ok. And obviously the finals are Ok.

Now the product detector itself could be dead. Or the switching circuit
which switches between the outputs of the product detector, the envelope
detector, and the discriminator to feed the audio stages could be defective.
These switches are driven by digital signals from the uP. The demux chip
could be defective. If the mode indicators don't light, this is likely the
culprit. If they do, then it is probably either the audio analog switch chip or
the product detector chip. Pull out the schematics and do a bit of signal
tracing and you'll soon find the problem.

That may work fine and dandy, unless Tim lives in a deep valley.
Usually you can make the cable hook-up (or an external antenna hook-up
for that matter) work by splicing the center conductor of the coax (a
clip lead works well) to the antenna and connecting the shield to one
of the screws on the back of the box that connects to the chassis of
the radio. It's actually kind of close to 75 ohms usually! Good
luck.

From: pauls@clark.net
Message-ID: <342406c6.9949592@news.clark.net>
Source record: 165702

I've downloaded the kachina demonstration program and it looks pretty impressive. Is there anyone actually using the transceiver that can give me there opinion on it?

I'm just about totally paralyzed and use my voice to control my computer. The demo seems to respond without any problems although I wonder if the space are push-to-talk will work for me. I don't seem to have the software capability for holding the space bar down continually.

Any thoughts/comments will be appreciated.

Build a trap for 6 meters. The coil is 6 turns 3/8 inch ID # 16 close
wound, the cap is a 5 to 50 PH trimmer capable of handling the 2
meter transmit power across the coil. Place this into the 2 meter
antenna coax and tune the trimmer until you no longer measure any 6
meter power coming down the 2 meter feed line. I have a friend who
built one of these and it works great. With out the trap he was
seeing 18 watts RF coming down the 2 meter antenna coax and being
input to the 2 meter front end. No diode limiter is going to stand up
to 18 watts RF.

I am looking for a a vox compatable headset for my Yeasu ft-530 but am having a problem find one. I am looking for a tactical style head set (type you see swat teams using. Small and unobtrusive.) The only one I have been able to find is listed in the Radio Shack catalog under Mortorola Spirit accessories (Part number RSU1143724 page 70 of the 1998 catalog) and I wanted to know if anyone has tried this headset to see if it will work.

If anyone knows of any other suppliers of this type of headset I would really appreciate any help.

Thank you
Angelica

I didn't know G5RV's had a trap. At any rate, try keeping the trap parallel with the ground and form a "drip loop" at each end with the transmission line. Seal each end with
GE silicon and drill a small weep hole in the bottom of the trap to allow moisture to escape.

What are the opinions of those that are using the FT890AT in mobil operation?
Is the tuner good enough to use with a compromise antenna? ie: one stick for most bands.

Does it have a transverter output?

My other option would be the DX70 with its auto tuner for long wire. ie: 108" whip. What about the SGC tuner?

Thanks for the input.

You are experiencing the classic signs of a ground loop. In a ground loop, return currents travel over a conductor shared by other loads. The current variations of those other loads modulate the "ground" potential seen by your equipment, due to the common I*R drop across the shared return conductor (in this case the vehicle body). According to Kirchhoff's Law, this is the same as if the voltage source feeding your equipment were varying. (You get the same effect if the "hot" lead is the one being shared.)

The *correct* solution to this problem is to not use shared conductors for the radio. Run your leads *direct* to the battery (both positive and negative). This eliminates the shared conductor, and will sharply reduce power line conducted noise. All of the radio manufacturers recomend this in their owner's manuals.

Fuse *both* leads near the battery. And generally don't cascade fuses, one per lead is sufficient. Cascaded fuses increase the voltage drop in the line to your rig (fuses, and their holders, insert extra resistance in the line), and solid state rigs want full battery voltage. They can get squirrelly if operated at a reduced voltage.

If you want rig power to follow the ignition switch, use a contactor (relay) at the battery to switch the power. Its coil should be connected to a source of power switched by the ignition switch.

Use of cigarette lighter adapters is *not* recomended except as a last resort in a rental vehicle where you can't run the proper wiring. A brute force line filter *may* help some, or it may not. But it isn't the *right* fix to this problem.

>KK4BH

The only thing that annoys the heck out of me with the Kenwood is desensitization on cw. A stong cw signal wipes out a lesser signal. The stronger one can be 1.5 kc away and it still wipes the weaker one out. I also have access to a Yaesue 990 and I can hear both signals on that radio.
Other than that, the Kenwood is great.

Source record: 165570

This is the third time I have sent this message. I have not seen it come through on the Ham-Equip Digest on either of the first 2 postings?????

Anyway...................

Hello,

I, for a while have had a thought that a computer based radio Voice mail system would be a very nice addition to our HAM shacks!

By that I mean, via the Mic/Speaker/PTT and Sound card connections one could use software to play and record incoming/outgoing voice message on out Ham bands (any band for that matter).

One could set up a voice mail system using DTMF_tones/CTCSS_tones etc and have a central system for a particular area giving not only personal voice mail to users but also club, geographical and local repeater info to visitors or whatever the designer wanted!

What I need to know is, is there any readily available software that could do what I am asking and if so where is it available from.

Any help appreciated.

> with the remote push to talk button, however. Since I really didn't
> want VOX, but was really looking for a push to talk headset, it works
> fine for my purposes.

Similar problem here - sometimes the VC-23 only works while the FT50 is
connected to the 12VDC cigarette lighter cable (maybe a voltage problem
with the VOX or the jack?)

The VOX will usually work if you power down the FT50; unplug the VC-23;
plug it back in; and then power up the radio.

Does anyone else have this problem, or know how the VOX gets it's power?

Still a pretty neat device, even if the VOX is a bit unreliable.

Thanks,

Art

One of the best things you can do is to wire direct to the battery and
eliminate the vehicle wiring. The battery is a great noise suppressor.
You could also add a filter between the battery and the radio
connection if going to the battery isn't enough.

> N1KED

Al,

In every noise problem the first thing to do is to determine if the noise is conducted or radiated. If it is conducted, it is getting into your radio via the wiring. If it is radiated, it is getting into your radio via the antenna.

If the noise is conducted, Gary's recommendations are good. I would add that the radio's ground should only be via the power ground wire. If you also ground the radio by mounting it to any metal inside the car, you can get a groundloop problem.

Good luck,
W0MAY - Dave

Since the radio is connected to the antenna and the antenna is grounded
(in most installations) you will still have a potential ground loop
problem so you might as well ground the radio. As Dave said, FIRST
determine if the noise is getting in via the antenna or the power
wiring.

6090. TS-830S Power output ?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-21 00:00:00 UTC
From: badger@vbe.com
Message-ID: <60478f$j84@news.vbe.com>
Source record: 165586

Having recently set up my "new to me" Kenwood TS-830S station I am wondering about the claims I see on some news groups regarding the "power" attributed to the TS-830S and family of transceivers. I consistantly get a little over 90 watts out (based on my also vintage AT-230 meter on all bands in CW. I know that the actual output can vary some but I have seen claims as high as 120 to 130 watts out. Are these guys mistaking input for output ? What should the approximate output be.... input is rated at 180W DC on CW..... I have heard that readings from 90 to 115 W are not uncommon..... depending on "freshness" of tube driver and 6146B final amp tubes (and of course state of tune and the accuracy of the meter). Any experience in this regard ???

First I want to thank the people who took the time to answer my questions
about the battery pack I was building for my HT but now I need some more help.

I am interest in the feasablity of modify my HT. What I am thinking about
try is modifying the the plastic battery plate on the bottom of my radio
with additional connectors (touch connetors like the existing battery
connectors) run from the external speaker jack but I would also like to run
a set of wires from the the antenna output to the bottom plate as well. Now
to the question I see no problem running wires from the speaker connector
but the antenna I am not sure about. As anyone who has openned their HT
knows their is very little extra space inside not enough to use coxial
cable only enough space for very fine gauge wire. Anyone know if it would
work running the rf output though this kind of wire.
What I am trying to accomplish is to make my HT like the Standard C510A.
Which using one connector hook all of the features RF and speaker to
external outputs for mobil operation.
The FT530 radio by itself (no battery or antenna) is about the same size
as a hand mike have one clean connector would make this a very nice setup.

Hope I was clear about my question and would appreciate any I can get.

Thank You
Angelica

It's also a good idea to see if you have the noise with the antenna disconnected. It is very common the get RF noise from the engine compartment (and other places) radiated to the antenna. Then there are some tricks to play (e.g., add grounding straps to make sure the hood is well connected to the body). Fuel pumps are bad actors in certain cars, too.

On one car of mine the biggest source of noise was being radiated from the rear window defroster!

Disconnect the antenna from the radio and see if you still receive the
interference. If you do, then it is coming in the power lead and the
filter might help. If you don't, then it is coming in the antenna and you
will have to take other measures to reduce the amount of RFI radiated by
your automobile.

Good luck.

Hi, Im surprised that the 'ol ARRL did not have anything, as I recall seeing a review of the R7000 ,maybe about ten years ago in QST. I have owned an R7000 for about that same amount of time and a good many other receivers/scanners for VHF/UHF . The IC-R7000 is to be honest, a very poor "scanner". HOWEVER,, it is by far the BEST receiver I have owned for VHF/UHF listening. It is the ONLY receiver that I have used that I can truely say, what I hear out of the speaker is in fact being received on whatever frequency is dialed in on the display.. Use of external computer control does help overcome many of it's "scanner" deficiencies. I bought mine new back when they were only a bit over $900. Good used ones can be found(occasionaly) for about $500 - 700. Except for the need to replace a couple of capacitors in a DC/DC PS, mine has run flawlessly. I would recomend use of external 12v DC power to operate the unit,to avoid internal heating from the transformer and regulators. I keep mine cool with an extrnal 220VAC fan(on 110 line).

Do like they tell you in the manual and connect the radio directly to
the Battery.

6110. Help - amp presents SWR to rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-21 00:00:00 UTC
From: Robert Brandon <rbrandon@austin.ibm.com>
Message-ID: <3425FA50.1AC6@nospam.austin.ibm.com>
Source record: 165606

I have a Yaesu FL-2100B amplifier that presents a pretty high SWR to rig.

The guy I bought it from had just replaced the finals - with JoLida tubes made in China. The manual says to adjust the input coils for each band if you change to a different brand of tube. I can't get rid of the SWR with these coils, however. At best (20M), I can get it down to 1.45:1. At worst, (15M) its 2.8:1.

Anybody run into a similar problem? I guess I could replace the tubes, but that's not exactly a cheap solution. I could also change the values of the capacitors on these input circuits. Any recommendations? This isn't normal is it?

Thanks -- e-mail responses appreciated. (Remove the "nospam" in the reply address.)

I inherited an antique Hallicrafters SX-28 "Super Skyrider" receiver.
Not being a ham, I realize that I'll never use it for anything, so I've
finally decided to try to find it a good home.

For the uninitiated, the SX-28 is an antique shortwave receiver with
enough dials on the front to run a nuclear power plant singlehandedly,
and its construction is sturdy enough to do a tank proud.

I don't know exactly how old it is, but the manual (which includes
full schematics), is dated November 1, 1943. The front cover says
"frequency range - .55 to 43 megacycles."

Part of the tuning knob is broken off, but the unit seems otherwise
to be in excellent condition. All the dial/knob captions are like new,
the glass in front of the dials is intact, and the whole case is in prime
shape. My uncle must have really taken care of it; If you didn't
know, you'd never guess how old it is just by looking.

I don't really know how to use an SX-28, but when I plugged it in,
I heard shortwave stations, even without an antenna attached. So
it looks like the electronics is all functioning.

It comes with the original manual, and the original separate speaker
and speaker cord (the speaker cord is thicker than the power cord!).

This receiver is obviously obsolete by today's standards, but it may
provide hours of fascination for the right hobbyist.

I've attached a .GIF image from my Quickcam, so you can take
a fuzzy look at it for yourself. The speaker is visible sitting on
top of the receiver.

I'm looking for $300 plus insurance and shipping from the Boston
area, but I'll listen to any reasonable offer. And you have to
promise to give it a good home :-).

Regards,
Mike Gilbert

6115. 19 New Microwave Distance Records set in VK !

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-21 00:00:00 UTC
From: Alan Devlin <adevlin@golden.net.au>
Message-ID: <34254BCF.5018@golden.net.au>
Source record: 165648
Cross-posted to: uk.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.misc

Gidday all,
below is a summary of a much larger document which describes a recent Amateur Radio Expedition in Australia, during which 19 NEW Microwave Distance Records were either Set or Extended in the Northern Territory (VK8), Queensland (VK4), New South Wales (VK2) and the Australian Capital Territory - VK1.

If anyone wishes to read the complete article (which I will say is a good "read") I can email it to you. It's in WORD6 format with few Pix & graphs & anecdotes.

The whole aim of this expedition was to inspire others into becoming involved in the wonderful world of microwaves. See you there !!!

Thank you.

Alan Devlin - VK3XPD,
Melbourne, Australia.

SUMMARY - VK1,2,4 & 8 MICROWAVE DX EXPEDITION - JULY/AUGUST 1997.

On a recent DX Expedition over a 2 week period from July 26 through to August 7th, a group of amateurs from VK3 & VK5 travelled firstly to VK8 then VK4, VK2 & finally VK1 and "set" or "extended" 19 Microwave Distance records.

The participants were Alan - VK3XPD from Melbourne, Russell - VK3ZQB from Port Fairy, Trevor - VK5NC and Colin - VK5DK both from Mt Gambier & David VK5KK from Adelaide.

Our achievements over this intensive 2 week period can be summarised as follows :

VK8 - 7 NEW records were set on 430 Mhz, 1.3 Ghz, 2.4, 3.4, 5.7, 10 & 24 Ghz.

VK4 - 2 NEW records on 3.4 & 24 Ghz and the 5.7 & 10 Ghz records were extended.

VK2 - 4 existing records were extended - 3.4 , 5.7, 10, & 24 Ghz.

VK1 - 3 NEW records were set for 2.4, 3.4, & 24 Ghz, and 5.7 Ghz was extended.

Had the weather been more favourable, several other "existing" 2.4 Ghz records would have been extended too !

A detailed account of the expedition is now available. It will form the basis for a number of articles in AMATEUR RADIO magazine and for distribution to WIA Broadcast groups and other interested groups/clubs.

Alan Devlin - VK3XPD for & on behalf of -

Trevor Niven - VK5NC,
Colin Hutchesson - VK5DK,
David Minchin - VK5KK and

Russell Lemke - VK3ZQB.

I am considering adding a new rig to my station and would like a HF+6mtr transceiver. The Kenwood TS-570S & Yaesu FT920 have caught my eye. They are both about the same price and was wondering if any of you out there have compared these two rigs and what your impressions might be. I previously had a TS-440 with good results but not had any Yaesu gear. Any inputs greatly appreciated.

6122. FS: TI 320C5x DSKs (DSP Starter Kits)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-21 00:00:00 UTC
From: Randy Cole <cole@netcom.com>
Message-ID: <34249A88.3764@netcom.com>
Source record: 165655

I have a few TI 320C5x DSKs (DSP Starter Kits) left for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened. I've sold a large number of these for $60, but I'm going to lower the price to $50 shipped for these last few.

I've sold a number of these to people on this newsgroup to implement filters for EME and other amateur radio-related applications.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from TI. The URL is:

ftp://ftp.ti.com/mirrors/tms320bbs/c5xdskfiles/

The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

TI sells these through distributors for $99, and purchasing them singly from distributors can be a hassle. I'll sell them for $50 each shipped within the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's check. Personal checks are fine but I may wait a few days for them to clear. At this price UPS COD just isn't worth the hassle, but I will do FedEx COD if you cover the extra cost. If you want a DSK send me a message and I'll reply with the information you need to order one.

>Thanks in advance.

In the Tech America catalog, Velleman, has a CW reader kit which uses an electret microphone to acoustically couple to the reciever speaker. I built this kit and it works fairly well, but as you might imagine, it takes a pretty clean CW signal for it to work. Noise will cause it to print out garbage.

Thanks for the information. I have seen on some radio equipment brochure
from either ICOM, Yaesu, or Kenwood (can't remember which one) that a
radio could be modifed for CAP which to me means Civil Air Patrol. Or
does CAP stand for something else? Please let me know if I cam wrong.
The aviation frequencies that I would use are in the 110 to 130 Mhz
range so the VHF side would work okay for me. I don't know why they use
AM seems like FM would be much better.

> Besides, transmitting outside the ham bands is illegal.

I guess that would be as a ham. I am a student pilot and I am going to
have to buy a separate radio to make transmissions on the aviation
frequencies anyway. What I would like to do is use the same unit to
transmit in ham bands as a ham and aviation bands as a pilot. I really
don't want to have to carry around two radios if I don't have to.

Thanks for your response. I appreciate your time responding to me.

Here's my 2 pittance worth:

I've been told that the TH-79 suffers from intermod more than others.

The IC-31 has been replaced by the 32. (It's not clear to me
whether you want new or used equipment.) There is a European
version of the 32 but don't know about the tone burst.

Am looking for a mobile radio comparable to the Yaesu FT50R (after mods). I am with a local Fire Dept. and need the radio to Xmit up to 490MHz on UHF, 172MHz-VHF, and receive 800 MHz band. The FT-50R is perfect for my needs but I would rather have a mobile then use my FT-50R with a Dualband amp.

Someone suggested the FT8100 but I cannot find anything on the possible mods.

Any help is greatly appreciated.

Best regards,

Dear friends,
I have problem with Alinco DR-130 VHF mobile.I could not exit
from its Channel mode.I look in modifications archive on net and I
found that I must hold VFO/M key and press on button but nothing
happens.When I try to reset station it stays the same,it locks on
Channel mode.Tranceiver is not locked,all keys works(I check).
Because it have been before in proffesional use iis it possible to
somehow lock VFO mode.On PCB I foynd two cut wires (blue and red)
I try all resets with combination with wires soldered or nor but
nothing happens.I noticed 24L02 EEprom inside.Is there some global
reset for DR-130 or other way
Thank You for help
Sacha

This is a good point. If the noise is radiated and being picked up
by the antenna, the cure is to eliminate it *at the source*. That
requires bonding and suppression in the engine compartment
(and often elsewhere in the vehicle too). Your description of
the problem leads me to believe you're facing noise due to the
ground loop though.

>If the noise is conducted, Gary's recommendations are good. I would add
>that the radio's ground should only be via the power ground wire. If you
>also ground the radio by mounting it to any metal inside the car, you
>can get a groundloop problem.

You really can't avoid this. The radio is going to be grounded through the
coax to the antenna (unless its a magmount or glass mount) anyway. What
you want to do is provide a *better* return to the battery which is in
shunt with the noisy body ground. Running both wires directly to the
battery (and using heavy enough wires too) is the way to do that.

Hi there
This message is meant for all of you who are wondering if they should transact ham business in the newsgroups. I have done so a couple of times and have never been swindled. I took a big chance in dealing on the net because I was in a hurry to sell. The guy I traded with, J.Murray Neece is a perfectly honest trader and is true to his word. I see no problem at all in recommending him as an "honest horsetrader" like he calls himself. Maybe he has a funny way of expressing himself but that probably is because a guy from Texas sounds real different to a guy from French speaking Quebec like me. Keep up the good work Murray and stay honest, it pays in the end. Who knows, maybe there is a hall of fame for honest people somewhere on the Net.

Don't you realize that you will be breaking the law by using a non-type accepted radio in the commercial band.
Why not just get a commercial radio that does what you want, they are made where they have vhf hi and uhf combined, then all you would need is a scanner for the 800 mhz.

The FT-50R is pretty bad. I was at a public service event this weekend and
I was getting hammered by "intermod" pretty badly. It was hard to compare
though, because other radios included the IC-2AT, IC-02AT, and the HTX-202
which hardly had a problem. I was a little worse off than the other dual-bander
(some older Icom) that I was around, but the older ham-band only rigs were
definately handling it a lot better.

I agree that wiring the rig directly to the battery is best
practice, and will probably help. One experiment would be to
temporarily power the radio off a separate battery, and see
if that made any difference.

You will probably need to suppress the noise at the source, as
described in the attached article I wrote a while back.

Richard

HF MOBILE NOISE ELIMINATION

In my experience, there are three parts to the job of installing HF
mobile in a vehicle: Installing the radio, installing the antenna,
and suppressing noise. Of the three, suppressing noise is probably
the hardest.

The first question is what kind of noise you are experiencing. If it
sounds like a popping noise, and gets louder when you accelerate, it
is probably ignition noise. If it is a hash type noise, it is
probably an electric motor. The engine fans on my Tercel were very
bad, but only ran in traffic, so I just lived with it. I was told
that .001uf caps, short leads, from the motor to ground would help,
but never did it. Some electric fuel pumps can be very noisy.

One test to see if the noise is coming from the power cable or the
antenna is to disconnect the antenna. If you still have noise, work
on the power cable. If the noise goes away, the power is OK, focus on
suppressing noise at the source. If you connect the radio power cable
directly to the battery, you will probably not experience noise on the
power cable. (Don't forget to fuse both plus and minus at the battery
for safety). Heavy cable is advisable; I would not use anything

smaller than 12 ga, and some people use welding cable.

I assume here that you have broad-band noise across various bands. If you have a single frequency birdie, you probably have noise from the computer crystal.

You might check to be sure that you have resistor plugs and wires before starting more serious work. Also, be sure that your noise blanker is on, although most radios do not have super-effective noise blankers.

On a 1979 Honda Civic with points, I used resistor plugs and wires, which solved the problem, but meant that I had to change the points every 5000 miles or so, as the ignition system was designed for resistor wires only, and if the ignition system was not perfect, the car ran poorly.

On a 1985 Toyota Tercel, I had tremendous luck suppressing ignition noise by buying heavy copper tubular braid, and slipping it over the spark plug wires. I built a copper box that covered most of the distributor, bonded the braid to the box, and then bonded the box to the block, keeping the wires short. This was a day and night improvement, and I never felt the need to do any more ignition noise suppression.

On a 1996 Subaru Legacy, I again built a copper box, and bought more tubular braid. However, I only got an improvement of about 2 S-units. I needed more, especially on 40 meters, so I ran two ground wires from the exhaust pipe to the chassis. This was probably worth more than 2 S-units, and finished the job to my satisfaction.

If you are systematic, you should be able to identify the source of any problems and correct them.

A couple of other notes on HF mobile installations. Don Johnson, W6AAQ wrote the book, 40+5 YEARS OF HF MOBILEERING. Try to get a copy. I use the Hustler antenna system, and find it adequate except on 75 m. If you plan to operate 75m, consider a WB5TYD Texas Bug Catcher or a Screwdriver antenna. Unless you have an automatic or remote tuning system, the antenna bandwidth on 75m will probably be only about 50kc or so. I have never invested the time and effort required to achieve a satisfactory 75m installation.

Good luck

Interesting that the price reduction on the 570S came today. QST -
which I received last Saturday - had a review on the FT-920.
Also Yaesu has extended their cupon until 11/29.

Go figure

Technically, yes, the trustee is responsible for taffic on
his repeater. In the real world, don't hold your breath for
the FCC to enforce for somebody's minor misbehavior.

I'd guess that the locals know this person -- and have
for many years -- and know that it's safer and easier
to ignore him than to try to make him stop.

Ignore it. Pick a different repeater to use.

It could be worse -- you could live in the Dallas/Ft. Worth area
and have to deal with a hundred people like that on every
repeater. Difference is, they ARE the repeater trustees.

The problem I'm trying to solve is RFI with my neighbor's TV and stereo. I've read the ARRL RFI book, put a
low-pass filter on my amp, put a hi-pass filter on his TV and ferrites on the speaker leads (RFI not affected
by volume control). There's still a little bit of residual RFI, and I'm to trying to get the last of it. I'm
pretty sure it's just plain old fundamental overload -- he uses rabbit ears and is almost directly below my

antenna. I told him I could put more gadgets on his stuff, but he keeps asking, "What about your end?"
He's been very patient, and I want to be absolutely sure I'm clean. My thinking is that getting all my tuned
circuits -- including the tuned inputs to the amp -- as resonant as possible would help.

My TS-450 does start to fold back the power when it sees about 2:1. At that point, output drops to about 50
watts and that in turn reduces the FL-2100B's output to about 200 watts. When I use the autotuner to match the
rig to the amp, the output jumps right up to a very respectable 600 watts or so.

I've gotten several responses, but any additional input would be appreciated.

I have the 706 mark 2 and prior to that I had the old 706. The Mark 2
does chop the dits but no where near as bad as the old 706. The internal
keyer is a pleasure to use and some who have heard me switch from qsk to
vox can't even hear the difference. With the old 706, I had to run in
vox mode set for .1sec due to the extreemely chopped dits.

Source record: 165518

There are several accessories available that plug into the same jack on the FT-50. I think the radio senses what is connected when it is powered up. If I have my VC-23 plugged in when I power up then it works fine. If I plug it in afterwards then the vox is disabled.

I agree concerning learning how to learn. It was expressed to me
while I was attending college by a professor that some of the
important aspect of college is that the student gains "tools" which
are used to pick apart problems and assemble answers.

Of course another college professor told me when I attempted to gain
more credit for a particular exam problem that "the world doesn't need
engineers who can get the right answers but does need those that do" -
I made a math mistake which ultimatley caused me to get the answer
wrong.

6148. Great Deal for IC761/DSP

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-22 00:00:00 UTC

Source record: 165520

I have for sale an Icom 761HF transceiver...this unit has quadruple conversion circuitry, keypad entry, built in tuner, keyer, built in power supply, new VCO, lots of bells and whistles...has been used at K3ANS contest station to rack up quite a few points...hears and talks great.

As a bonus, I'll throw in my DSP-9 audio digital signal processor free of charge. This cuts noise, hash, dumped carriers, etc., and has filters to 100 Hz...is superb unit.

This rig is great upgrade for someone looking to get into a serious radio from the entry level ic735/ts440 kind of rig. It's VERY quiet and solid. Unit is operational now so can test on air.

Im asking $1050 OBO + s/h from Allentown PA (near Philly and NYC). Can possibly deliver within several hundred mile radius. If interested, call Bob/WF3H at 610 261 9137 or email wf3h@enter.net

Thanks...you wont be disappointed!

>Al
>
I would recommend against using the cigarette lighter plug to power a rig like that. A cigarette lighter plug with a 20 amp fuse??? I wouldn't recommend using over 5-7 amps on a cigarette lighter plug. The contacts just are not rated for much more than that. Even the heavier plugs.

My suggestion would be to take your power cord through the firewall directly to the battery, have BOTH leads fused. This generally clears up a LOT of alternator and ignition noise when you install a mobile unit in this manner.

Kenwood has used an unstable "glue" in the VCOs for the various
bands. To fix the problem you need to remove this "glue" and repair or
replace any components that are damaged from the corrosion.
Best done by removing the PC board and "picking" the "glue" free
from the areas. A process that takes some time but worth the effort.

Do you have a local ham store? Why not patronize them? MFJ is one of the
few companies left that support local dealers, the major Japanese companies
don't.

This message comes from Jerusalem where there are NO local ham stores!!

Source record: 165534

For Sale:

Two Radio Towers. Ideal for satelite dish, Ham radio, TV antenna etc.

Each tower consists of two sections approximately 15 ft high providing approximately 30 ft
in height. At the top of each tower is a mounting bracket to accept 1" pipe.

These towers are used, and have surface rust, however they appear structurally sound.
They are iron, and have a triangular cross section. The base section is approximately 14"
on a side at the bottom and approximately 8" on a side at the top. The top section bolts
to the bottom section with 3 bolts, and is approximately 8" on a side at the bottom and
approximately 4" on a side at the top.

Asking $100 each.

I _very_ new to HF and have a question.

I have a Kenwood TS-830s HF rig that I have used with a 40 meter dipole. The dipole is not very high off the ground (10 feet) and it runs about 2:1 swr, depending on which part of the band I'm on.

I bought an antenna tuner this weekend at a hamfest. Drake ST-2. It has a 17 tap inductor and transmitter match and antenna match knobs (variable caps). It also has forward and reflected power meters. The instructions say to center the caps, find the best match with the inductor by listening to the noise in the receive and maximizing it, then tune for min reflected power with the two caps.

My question is, when and how do I tune the finals of the radio? Do I need a dummy load now to tune the rig, then reconnect and tune the antenna. Also, I thought I should see about 180 watts forward power, but I'm only seeing 100 watts. SWR from the rig to the tuner is almost 1:1 so that part works.

I looked in all the books I have and have no straight answer for this question. Thanks in advance for your help.

Regards,
Mike Maiorana

The FT-920 review is in the October QST. Sounds
like it has a good rx, but the tx is lousy. It
could be a prolific TVI generator. There is no
excuse for such a dirty transmitter.
KN0V
such a dirty transmitter,

Bayha,
I live in dallas, and have made many purchases at Texas Tower. I have never had a problem there.
If you visit there, you will notice they are very busy handling phone sales. They have gotten the reputation in town as acting as if the walk in customers were a bother. But, they have excellent prices, retain almost everything in stock, and have a lot of ham knowledge available to help the beginner.

I purchased an mag mount antenna there that wouldn't stay stuck, they refunded my money without
a problem even though the antenna had been dragged down the highway and damaged...

I purchase a lot of items there, radios, etc., even though I have to pay sales tax and I could order
elsewhere!

Other than doing a full reset of the radio, you can't. Mask it or overwrite
it. Masking is essentially the same as deleting except you can get back the
stored information as long as you don't overwrite it first.

Can the FT-51 pick up aviation bands? If so, can modifications be made so that the unit can TX as well as RX?

I am a student pilot and I am looking at getting an ICOM A22 but if the FT-51 can do this then I would get the best of both worlds.

90 to 110 watts is about right. PA efficiency should be in the range
of 50% to 65%, so that works out right with 180 watts input. Fellows
getting more power out than that are overdriving the PA and are
probably splattering up and down the band.

Note that you only have 70 watts of plate dissipation total in the
rig, so avoid long key down periods at maximum output or you'll
cook the tubes. For RTTY or AM, crank the power down to about
half what you'd run on CW or SSB and your finals will thank you.

Howdy,
I have a ft-50r that is only a month old. Never been dropped.
Three times now, pushing the on button has failed. The rig will not power up.
Only after removing the battery pack and putting it back on will the rig power up.
Voltage indicator reads good charge. It seems to be a logic problem.
Because I really
jiggled the pack and tried it without removing the pack. I think I moved the pack around enough to get
around a possoble oxidized contact.
Has anybody heard of this "problem" ?

My Mitsu book lists the M57719 as a 140 MHz FM hybrid power module (with an 'L' suffix). 10 watts out, 12 volt
supply, 18.4 dB gain, 200 mW in gets 14 W out.

> isn't normal is it?

Before anyone can recommend a solution, could you be clear about what
is the problem that you're trying to solve?

Rigs with automatic tuners should handle up to 3:1 without any trace
of distress and fold-back. If your exciter is still able to provide
enough drive for the FL-2100B, then the only problem I see is the
"untidiness" of the reflectometer meter readings. And the solution
to that is to stop measuring the VSWR into the amplifier :-)

As to whether it's normal, I can't believe most people even make that
measurement unless they are trying to solve a condition of low drive.

One successful technique is "shunning." Just ignore any calls to/from the offender, don't respond to his CQ's or "Break's" unless it's an emergency. If he start jamming, then you have something to take to the FCC. We've re-educated several operators who didn't respond to other methods corrective action. As for jammer, we have a field office here and several of the agents are Hams too.

>work running the rf output though this kind of wire.

You *must* use coaxial cable for the RF output. You could use very
small 50-ohm coax like RG-174, and there is at least one other type
that is even smaller. The small coax won't cause significant losses
when the length is only a few inches. But using a plain wire is
unlikely to work for two reasons: it does not maintain a constant
impedance path from RF amplifier to antenna, likely reducing power
output, and it will also radiate RF into parts of the HT that it
passes by - parts that were not intended to withstand that RF level.
Coax maintains the integrity of the RF signal path, and also keeps
the RF inside the cable where it belongs.

>What I am trying to accomplish is to make my HT like the Standard C510A.
>Which using one connector hook all of the features RF and speaker to
>external outputs for mobil operation.
>The FT530 radio by itself (no battery or antenna) is about the same size
>as a hand mike have one clean connector would make this a very nice setup.

You still have a number of potential problems to deal with. The connector
used for the RF output should also be a 50 ohm coaxial connector. You
can use miniature connectors like the MCX or SMB to keep the size small,
but simple pressure contact connections like the battery users are *not*
likely to work very well for RF.

Also, you may find that if you want to continue to use the 530 for
handheld use, as well as in the car, you may need some way of switching
the RF output between the top-panel jack and the added bottom jack. You
can't just leave both outputs connected all the time in a "Y" arrangement,
even if only one is used at a time. The several inches of coax that
runs from the antenna jack at the top of the radio to the new jack on
the bottom acts as an open-circuit transmission line "stub" when nothing
is connected to it, and this can cause problems both receiving and
transmitting - particularly on UHF, where the stub is a greater fraction
of a wavelength.

I wish you luck, but you're tackling a difficult job. Standard must have used some special connectors and done something clever about routing the RF signal in order to make the C510 work with the single "umbilical" connection for RF, DC power, and audio.

Dave

I've been having a big problem with my FT-11 which gathers all the signals and noises around so that I can't leave it on in a crowded bulding or near a strong station. I think it's an intermodulation problem that my old Standard C520 doesn't have.
So I decided to get some informations before buying a dual bander this time. Does FT-50 has this kind of problem? How is IC-31 or IC-T7? TH-79? Alinco, etc.?
Does any of these models (american or japanese model) have 1750Hz tone burst for european repeaters?

6185. Re: FT-51 and Aviation Bands

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-22 00:00:00 UTC
From: davem@harpo.cs.ubc.ca
Message-ID: <60655k$f1o@harpo.cs.ubc.ca>
Source record: 165557

thelms@mindspring.com (Trent Helms) writes:
>Can the FT-51 pick up aviation bands? If so, can modifications be made
>so that the unit can TX as well as RX?

The FT-51 can pick up the aviation bands on the "left" (VHF) receiver;
it has the necessary AM detector. The "right" (UHF) receiver has no
AM detector and won't work.

I haven't heard of a mod that allows TX on aircraft. It's likely technically
impossible, since you'd need an AM modulator and linear power amp in the
radio to transmit AM. The FT-51 is designed as an FM transmitter, and
so has an FM modulator and a power amp that is probably non-linear, with
feedback for power control.

Besides, transmitting outside the ham bands is illegal.

>I am a student pilot and I am looking at getting an ICOM A22 but if the
>FT-51 can do this then I would get the best of both worlds.

I've never heard of *any* HT that would transmit AM on the aircraft
band plus FM on ham bands, legal or not. Buy the Icom.

Dave

I myself was able to purchase the adaptor stand CA-15 and FNB-49 6v 600ma
battery for 35 dollars at a hamfest. The charger is a slow charger 10-18
hours but with two packs this works out fine.
Most any dealer should carry this option for the FT-50

6188. Going price for HTX-202 & Pro-43

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-23 00:00:00 UTC
From: The Larsons <vct@gomontana.com>
Message-ID: <60a2rc$ln81@news.gomontana.com>
Source record: 165360
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner,alt.radio.scanner

I have a Realistic HTX-202 2m handheld and a Pro-43 scanner that I am considering selling. Can anybody tell me what fair prices would be for these?

The HTX-202 is as it came out of the box. The Pro-43 has the cell mod, low band coverage mod, upgraded internal speaker and the service manual. Both include all accessories that they came with including the manual and box.

Thanks for your advice,

Don Larson

> > 73 de Hyun / F5CHU (ex HL1MV)

Any h/held transceiver (currently available from the main manufacturers)
will have a 1750Hz toneburst fitted. If buying a rig in the USA for use
in Europe, be sure that you can enable a 1750Hz toneburst and also that you
can enable the various frequency shifts we use in Europe for 70cm repeaters

>Also Yaesu has extended their cupon until 11/29.
>
>Go figure

I've had an FT-920 for about two weeks. I gave a very serious look at the TS-570D since 6M capability was not etched in stone and with the coupon it was $500 less than the FT-920. The new radio replaces a Kenwood TS-930 which replaced a TS-140. My main reasons for choosing the Yaesu product were features, ergonomics and a desire to try Yaesu (many of my friends own FT-1000 series rigs). The TS-570 was too small for my taste in a base station rig although I'd love to have one for a portable station. The FT-920 is easier to operate with many more controls brought out to the front panel in addition to the extensive menu system. I A/B tested both rigs at HRO and the receive quality was similar. I favored the 570 by a hair but not enough to overcome it's awkwardness. I was also very concerned about the painted rubber buttons on the 570. A Kenwood HT I owned had similarly labeled rubber keys and the markings were gone in six months. Maybe they've improved the paint - maybe no - but I didn't want to take a chance for that much money. Since getting the FT-920 it's been a good performer. Mine is from the sixth production run and, as far as I can tell, the earlier problems have been resolved. All in all I'm satisfied with my choice.

ICOM makes some Land Mobile rigs that will do what your looking for (legally, too) and cover the Ham bands as well. They are user programable, but not quite as straight ahead as a ham rig. I don't have the model numbers, but check with a land mobile radio dealer.
Going this way, you'll get good performance in the Land Mobile portion, as well as the Ham portion and be type certified (Legal).

Hope this helps Ned

Realize that no currently produced amateur radio is Type Accepted for
use in the Public Safety radio services (or Land Mobile, or Aviation, or
Marine for that matter). This means it is *illegal* to use them under a
license for these services. If you do, you put the license under which
you are operating in jeopardy. Do you think your chief will like it if
the department's license is revoked for your illegal activities? I expect
not.

The many violations of this law are causing the FCC to take a very hard
look at tightening up the regulations applying to importation and sale of
amateur equipment so that it will be much harder to modify amateur
equipment to operate out of the amateur bands. This will not be a good
thing for amateurs who use this equipment legitimately because building
in such limitations will likely make the equipment less flexible for legitimate
amateur purposes, IE to drive a transverter for example. So please, don't
use amateur radio equipment in this illegal manner. Use a radio Type
Accepted for the service in which you intend to operate it.

Hello.

Has anyone seen published information of improving the receive converter performance (specifically improving the noise factor) in an old (circa June 1976) Mickey Mouse 432MHz transverter?

This would be the unit preceding the -S suffixed design.

The circuit diagram that I have shows the semiconductor lineup being BFR34A (or MRF904) 1st RF, BFX89 2nd RF, 3N304 mixer.

The unit I have works fine, however, the noise floor sits around S5-6 on my FT107, and does not change whether the aerial is connected or not.

Oh, please reply to the address ccox@uhc.com (or chrisc@chris.org) as that shown in the originator address is corrupted to try to minimise the amount of spam received...

thanks in advance, and 73

I'm am desperately looking for modifications on Kenwood TS 780 VHF/UHF all mode base rig!

I want to:

- Extend the RX range (want to be able to receive around 150 MHz)
- Improve RX sensibility (is quite OK but if possible better RX would be nice)
- Pump up the HF power if possible (is now 10 watt, I've heard that 3dB gain is possible)
- Setup the Signal meter properly (The needle's a bit heavy.. hi)
- Change the "low power" settings (should be 1 watt, is now 180 mW)
- Built in CTCSS (To open "modern" repeaters)

The Kenwood TS 780 is a 80's VHF/UHF set, please be so kind to review your "old" docs and help a just started Dutch HAM friend out!

Thanks in advance!

6212. Suggestion for HT.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-23 00:00:00 UTC
From: Gerald Crenshaw <gerryc@airmail.net>
Message-ID: <494E844590B61DEA.7AA5225F4732DB67.9D8E1FF23DD77A94@library-proxy.airnews.net>
Source record: 165430

Hello,
I will soon be buying 2 new HT's for my wife and myself soon. The last public service event we worked finally lead us to belive that having the same type radio for both of us is the way to go.

I have looked at the pages on the Web for most of the manafactures but they do not spec out the connectors. All I see is sales hype.

Here is what we want in a HT,

Dual Band
BNC Antenna Connector
Run on 13.8 Volts external power
External power connector must be somthing I can buy at Radio Shack
Speaker mike connections must be somthing I can buy at Radio Shack
(I will not buy another radio with proprietary connectors)
Battery pack that can use standard AA batteries
Extended receive for NOAA Weather and EMWIN reception
Cloneable or computer programable.
Somthing that will be in production for more than 1 year. (My oldest daughter will be getting her license soon and I will want to buy the same HT for her)

Suggestions anyone?

Gerry WD4BIS and Janet WB9ZPH

> K8BVY

Look at the wiring diagram of the mike connector and see if there are up
and down connections. Try shorting them to ground and see if there is
the desired effect. If so, it's the mike. The voltage to the switches
may be defective, or the wiring in the mike.

$400 for the basic radio then add the extras.

With all extras that make it like a TR7A with the remote VFO, speaker,
and operaters manual. I have seen them up to $900 if very clean. So

Message-ID: <34281257.3B00@inde.mct.anl.gov>
Source record: 165434

Why is it necessary to fuse _BOTH_ plus and minus at the battery?
The battery minus is usually connected to the engine block and the
fender/firewall/body somewhere. Is not the fuse in the negative lead to
the radio superfluous and possibly a hazard? Ground retrun through the
vehicle negative system/frame would seem to bypass this fuse?
I'm _NOT_ suggesting that it is not necessary. I'm just curious _WHY_.
This same wiring schem has been mentioned by others.
Thanks for your reply.

Unless there has been a recent change, ARRL VEs use the
Farnsworth Code for the 5 WPM and 13 WPM tests. The
20 WPM test is given using Morse Code. (Both Farnsworth
Code and Morse Code are timing codes, but since they use
different timings, they are different codes.)

The 13-wpm test was not Farnsworth when I took it, but that
was back in 1988. The 5-wpm test wasn't Farnsworth when I took
it, but the last time I took it was in 1987.

I should have qualified my statement to indicate that I was
basing it on how the tests were given 10 years ago.

>Standard C520 doesn't have.

There seems to be a general tradeoff at work here: If you buy a HT that will not receive or transmit out of band, it's probably pretty immune to intermod, because the RF front end will have filtering that attenuates non-ham frequencies. The Radio Shack handhelds are like this, for example.

On the other hand, if you get a handheld that has very wideband receive, the front end *cannot* have such fixed filtering in the front end, and you will suffer from more intermod, particularly if you replace the original rubber antenna (which is often a decent attenuator) with a more efficient antenna. An antenna that is 3 dB better makes the signals you are trying to hear 3 dB stronger, but second-order intermod is 6 dB stronger and third-order intermod is 9 dB stronger.

Thus, handhelds with really wide receive, like the FT-50, tend to have the worst intermod problems. I find that the FT-51, which only receives "a little" above and below the 2 m and 70 cm bands, has less problem with intermod than the FT-50, which goes down to about 70 MHz and up to 900 MHz.

Some mobile and base radios do better than this, by making the RF front end tuned, and having its passband slide up and down in frequency along with the VFO. But this is more expensive, and takes more parts and more power, and handhelds don't seem to do it.

So if you want to listen to ham bands only, buy a radio that doesn't work out of band.

There is another solution if you sometimes want to use your radio as a scanner (so want wideband receive), while at other times want only ham band operation: Use a bandpass filter to eliminate other frequencies when you want ham-only operation. DCI (and others) make passive bandpass filters that have very steep skirts outside the ham band of choice, drastically attenuating nearby commercial frequencies, and thus greatly reducing intermod. However, such filters are single band - your dual-band HT becomes a 2 m or 70 cm radio only.

Hi Mike,

Here's your answer:

If you're using an external antenna matching device of any kind with a
tube-type transmitter, always tune the transmitter into a 50 Ohm load
first, then switch to the tuner and adjust its controls. Once you've
adjusted the transmitter's PA controls into the 50 Ohm load, DO NOT
ADJUST THEM AGAIN. You won't need to, unless you change frequencies
across a big section of the band. Obviously, you must repeat the
tuneup if you change bands entirely.

> 73 from Dean, K5DH

Mike,

Dean is correct. I would add that you might want to log the tuner dial positions for each band and it might make tuneup a little quicker. Also, 100 watts is about all you will see with the TS 500/800 series of radios. 180 watts is input power, 85 - 115 is about the average output power depending on the band. If you are using a wattmeter that is not a peak reading meter, then you will see voice peaks ranging from 25 - 40 watts with a sharp whistle bringing it up to the meter's 100 watt measurement. this is normal. On CW you will see the full output on the meter.

Bry, since you are obviously a list expert, would you care to enlighten us on what you think it costs to run an operation like Jack runs and how much you think the citizens of Tempe are paying to support the "free" lists?

I will make a simple suggestion: There is a switch on the
hand mike that basically turns those buttons from active to
inactive. If that switch is in one position, the up-down
buttons on the hand mike do nothing. Check the switch.

> Thanks for your reply.
> Dick, K9FFK

The rationalle is based on a somewhat unique failure mode.
The generator is mounted on the engine.
The connection between the engine block and the
battery (negative) ground may be a single strap. Imagine
if this strap were to break or fall off. The generator
current (maybe 50 or 90 amps) or the starter current
(200-300 amps) would have only one path to go to the battery:
Through the antenna coax (braid connected to auto chassis ground)
or through the radio mounts and then through the radio ground
wire, which would be connected to the battery. If there is
no fuse in the radio ground line, that line could burn up
with the high current, perhaps damaging the radio, coax,
etc. The fuse in the ground line is to protect against
an eventuality such as a motor ground failure.

I don't have an easy way to send a schematic diagram to
the newsgroup, but draw a simple block diagram and then
start introducing selective failures in certain circuits,
and figure out the current that could be carried by the
radio ground line. You will not like what you see,
so fuse the wire that goes between the radio and the
battery negative terminal.

The military covered their antennas so they would not poke their eyes out. Ofcourse switching from HF to UHF will shorten your antenna quite considerably. Therefore a cover of some sort was necessary to prevent eye gouging. Some crook out there is trying to make big bucks by taking advantage of the public's ignorance that some piece of whatever that goes over your antenna will improve reception.... Anyone that knows the physics involved will laugh at that... Maybe again, there's money to be made....

Wattmeters are not the most accurate instrument so it could be you are getting the proper power. No one will be able to tell the difference between 90 and 115 watts on the air anyhow. However, if I remember my TS830S correctly you could get in and retap the power transformer to raise the plate and screen voltages if you don't mind burning up the finals sooner.

I agree with you, Mark.

You are limited in finding the features of an amateur radio (dual band, user program, etc.), with a "commercial" label on it. It's too bad "the law" is in the way of you using the best equipment available to suit your needs. Maybe efforts should be directed toward exempting public service users, like yourself, from the "type approved" provisions of the FCC regulations. Amateurs should not feel threatened by this, nor should they fear radio operators like Mark interfering with their transmissions - I'm sure he's too busy making rescues to bother using his radio in bands he shouldn't be in. This is strictly a matter of supply and demand - if the manufacturers can't give these public service professionals the best features and equipment to do their jobs, then we should let them work with what is currently available.

>range so the VHF side would work okay for me. I don't know why they use
>AM seems like FM would be much better.

The Civil Air Patrol is effectively an auxiliary unit of the military
(the Air Force, I think). As such, they are allowed to use military
frequencies that are outside, but adjacent to the 2 m ham band.
But FM is used on these frequencies, so all that is needed to make
a ham transceiver usable on CAP frequencies is to alter the programming
to allow selection of the appropriate frequencies (plus hardware that
has a receiver and transmitter that can work a little outside their
designed frequencies). This is all legal, because the military "own"
the frequencies, and they've decided that modified ham equipment is OK
for use on those frequencies.

But note that a CAP airplane must still carry their AM aviation band
radios to talk to air traffic control. The CAP-modified FM rigs are
for other communications, like talking to people on the ground.

Aviation started using AM for historical reasons - that's what was
common when the system was set up. It continues to use it because
it continues to work well in that environment.

>> Besides, transmitting outside the ham bands is illegal.
>
>I guess that would be as a ham. I am a student pilot and I am going to
>have to buy a separate radio to make transmissions on the aviation
>frequencies anyway. What I would like to do is use the same unit to
>transmit in ham bands as a ham and aviation bands as a pilot. I really
>don't want to have to carry around two radios if I don't have to.

To transmit in the aviation bands, you need several things:

- you, as pilot, need to be licenced - a Restricted Radiotelephone
Licence or equivalent

- the aircraft has to have a radio station licence

- the actual radio equipment used must be certified for use
as a transmitter in the aircraft bands.

(this is for Canada; the US may differ).

A modified ham transceiver, or a modified *anything*, will fail the third test - it isn't legal to use it to transmit in the aircraft band, even if the pilot and the aircraft *are* properly licenced.

It would be possible for a manufacturer to build a radio that was designed to work in both aviation and ham bands, and certify it for both uses - then you could use it in both bands (provided, again, that pilot and aircraft are also properly licenced for both services). I don't know of any such radio, however.

It *is* possible to use a modified transmitter in the ham bands, if you are a suitably licenced amateur (Advanced licence, in Canada). So I could start out with an aviation radio, modify it to work in the ham bands, and then use it - transmitting either AM or FM. But once I modified it, it would no longer be legal for the aviation band.

In short, there is no way to do what you want to do legally, unless you convince a manufacturer to build a dual-purpose radio. And even ignoring the legalities, the difference in transmission mode (AM vs. FM) makes it technically difficult to do.

Dave

Source record: 165492

Adding a bit more info:

Modifying an amateur handheld FM rig to work in the MARS or CAP bands is often technically easy - it's just a programming change on many radios. It's also legal if you're involved in MARS or CAP, since the military controls the frequencies and chooses to allow use of modified radios.

Modifying an amateur handheld FM rig to work in other commercial services that use similar FM standards on nearby frequencies (business, marine, fire department, police) is still technically easy on many radios, but it's always illegal because the modified radio isn't approved for that band, and the regulatory authorities do *not* allow use of modified radios in these bands.

Modifying a FM handheld to work on AM aircraft band is both technically challenging. *If* you get it to work, using it is illegal.

Dave

I bought the TH79E about 2 years ago & its receiver is not too bad for intermod - pretty good compared with some other h/held rig's. It works better if you switch it off Dual band mode & use only 2m or only 70cms. I previously had an Alinco DJG1E (2m tx, but wide band rx 400Mhz to 990Mhz approx) & it suffered no intermod problems at all. TH79 is certainly better here in GM land than equivalent Icom dualband h/held's of the same vintage.

GE used simple pressure finger connections on their PE series of HTs
to interface with the car adapter. So this will work, but expect to do some
good engineering to make it work correctly. Basically, the lead and finger
reactances have to be made part of the output network.

>AM seems like FM would be much better.

These MARS and CAP frequencies are *not* the standard AM aircraft
frequencies. They are *military* frequencies, and the VHF ones use FM.
Both MARS and CAP are military auxillaries. The military does not fall
under the jurisdiction of the FCC, and has a different set of standards for
operations on their frequencies than the FCC imposes on civilian operations.
That's why non-Type Accepted amateur equipment can be used for MARS
and CAP activities. But it can't be used for General Aviation purposes.

>> Besides, transmitting outside the ham bands is illegal.
>
>I guess that would be as a ham. I am a student pilot and I am going to
>have to buy a separate radio to make transmissions on the aviation
>frequencies anyway. What I would like to do is use the same unit to
>transmit in ham bands as a ham and aviation bands as a pilot. I really
>don't want to have to carry around two radios if I don't have to.

The problem is that radios used in the aviation radio service are required
by law to be Type Accepted for that service. No amateur equipment carries
that Type Acceptance. It is illegal to use equipment in the aviation service
which isn't Type Accepted for that service. This is also true for the
commercial Land Mobile service and Public Safety services. Use of

modified amateur equipment in any of these services is *illegal*
because amateur equipment lacks the proper Type Acceptance for
operation in these services. So if you want to remain legal, you have
to buy the proper radio for the service where you want to operate.

Amateur radio equipment doesn't require, and doesn't qualify to have,
Type Acceptance in the aviation, land mobile, or public safety radio
services. So you can't legally use it for those services. Period.

As a pilot, you should be familar with this idea that you have to use
things which have the proper certifications on aircraft. You can't
just use any old kludge, the stuff has to have the proper certification.
This applies to radios just as much as it does to engines, airframes,
or instrumentation. The only difference is that the FCC is the
relevant certifying agency for radios while the FAA does the
certifications on the other items. (There is some joint regulation
in some cases as well.)

Hi--

I believe the NH CAP has a repeater operating on 149 MHz FM. I think this FM service is what manfacturers are talking about when they say "can be modified for CAP". It's a cute way of saying the rig can be modified for out-of-band transmitting use, since I believe (and I could be wrong) CAP communication is the only "legit" out-of-band use permitted for non-type accepted ham equipment.

> My thinking is that getting all my tuned
> circuits -- including the tuned inputs to the amp --
> as resonant as possible would help.

Unfortunately, your situation is probably not one where spurious signals from your rig are reaching your neighbor's equipment. It's more likely to be a simple case of proximity between your Tx and his Rx! I've had situations similar to yours (I used to live in a condo), and unfortunately the more power I put out, and the better SWR I tuned up, the more intense the interference to my downstairs neighbor.

That said, I'm using a TS-450 into an Ameritron 600W amp one room away from my 27" TV (and couch-bound family). Only on 17m, and only with the amp, do I get any interference. That interference doesn't show up on the TV itself, but rather through the hifi amp/speakers that I pump the TV through. It seems that the speaker wires presents an attractive length to whatever RF energy is floating out there in the living room.

The location of your antenna is more likely to help ameliorate the problem, as is the effectiveness of your station ground system.

Ref my message above, I just talked to ICOM technical support, and they
indicate that my new rig is probably quite all right. They've received a
lot of inquiries about the lack of ALC indication and read me a response
from the ICOM home office indicating that the manual for the Mk-II should
have been, but was NOT, revised to indicate the lack of ALC indication.
In brief, it is NORMAL with the Mk-II to get little if any ALC indication
at normal voice levels.

Yeah, I should have checked with ICOM before posting .... :) But perhaps
the info may be of use to other new users. 73 Jim W7JIT

One of the biggest advantages of the eBay auction over the newsgroups for buying and selling is the feedback feature, whereby positive or negative comments can be left by any registered user regarding another registered user. Thus, when contemplating making a bid, or selling an item to a high bidder, one can see the actual comments made by others regarding the person in question. Since you have to be a registered user to leave comments, and your name, address, and phone number are available to any other registered user, anonymous comments cannot be sent. If only there were a way to set up a system like this in a newsgroup, it would greatly improve your chances of making an honest deal, and would eliminate a great many of the flames from the groups.

From: Brian Maynard <MAYNARD@URIACC.URI.EDU>
Message-ID: <34293F2E.8DC@URIACC.URI.EDU>
Source record: 165266

I have owned Yaesu equipment, specifically the FT-767gx, and now own a TS-570D, which I like quite a bit. I was wondering if I should have bought the 920 until reading this month's QST review. They trashed the 920, but liked the 570D reviewed last winter. The sensitivity specs, the only positive about the 920, were still not as good as those reported for the 570D. The only problem with Kenwood is apparently their service department is not very good - Yaesu's is excellent.

Oh also, a big point for me is that the Yaesu is a BIG rig, same size as the 1000. The 570 series are small rigs, idea for field days and mobiling.

If I were spending your money, I would buy the 570S. Good luck!

Brian, K1NW

Both of the responders, G. McCouch and M. Maiorana have given you excellent information. If I might add another point or two -

When you are doing your tuning prior to arriving at final settings, if there is any way to reduce your power level, that should be done. I have an all digital, solid state rig, but I am old enough to remember tube rigs - Hi.

It's also important to do the tuning in short bursts - i.e., just a second or two of key down at each shot. As George said, it's real good to record those tuner settings, because that's the tuning that may be very sharp, and of course you have to keep separate records for each antenna if you are using more than one antenna.

>Brian, K1NW

Brian -

While we all want to think we've bought the "right" rig it's a subjective process. In my case I bought the FT-920 a few days before the QST review and would have made the same decision if I'd seen the review first. I played with both the TS-570S and FT-920 at HRO over two visits. The BIG point for me was exactly opposite your's. The 570 was too teensy. I wanted a base station not a portable so larger panel controls and more of them was important. The FT-920 has very good ergonomics. I have owned both a TS-930 and TS-140 so have nothing against Kenwood. The FT-920 replaces a now dead TS-930.

QST did not "trash" the FT-920 or did the TS-570 go without criticism. The 920 transmitter critique at the end of the review is intellectually interesting but has little bearing on my real world operation. So far the guys with scopes have seen nothing amiss with my signal. Someone else might find it more important. The 570 was taken to task for the same problem I found - poor ergonomics. Too few controls and too many functions invested in a single control. The thing that most put me off the 570 after size were the painted rubber buttons. I owned a Kenwood HT with a painted rubber keypad and the labels were gone in six months. I assume they've improved the painting technique but didn't feel like risking loss of important labels.

As I said, it's a subjective process. We weigh the factors that are important to us and make decisions the next fellow would make differntly.

73,
Larry, W1MW

Phil,
I agree. It is a good point and a valuable service.
I too have valuable radio and computer equipment to protect. Also been tracking this storm and it looks like it will prove to be a little more powerful than expected...

as for the other guy telling someone to go hide under their ham-shack table.... I think it was in poor taste. He did some of us a serives and Joe did a lot of us a DISSERVICE.

Bryce,
Having been out here nearly 20 years myself, I have seen what a major
storm can do to this place. You're right, Arizona isn't even close to be
prepared. Right now, it is overcast in Phoenix and the wind is starting
to pick up.
Local news is putting out bullitens about recommended items to have in
the home, etc. This may prove to be just as exciting as the great floods
of 80,81.

6293. PC Interface for FT-51R and IC-R10

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-24 00:00:00 UTC
From: Brian Lee <blee@nortel.com>
Message-ID: <3429B403.1794@nortel.com>
Source record: 165281

Here's a TTL to RS-232 converter which works great with my Yaesu FT51R
through the cloning port and my Icom IC-R10 through the CI-V interface.
Haven't tested but should work for other Yaesu and Icom radios also.

(FYI, 51R settings are 9600,8,N,1. R10 settings are <baud>,8,N,1.
R10 baud rate is set through the radio configuration. But during cloning,
it seems to default to 9600. I'm still deciphering the 51R data. I'll
post after I figure it out)

I've modified the circuit I found in this article from
www.cdrom.com/pub/hamradio/oak/mods/icom/ic731.mod
Follows is the article in it's original form. At the bottom is my
modified scematic. Basically, I got rid of the 7417 chip and made the
circuit self contained by drawing power from the serial lines. The
output of the ICL232 is now connected to the radio through a wired-OR
connection via D1. You might need to experiment with the R1 pullup
resistor. I found that my 51R would not accept cloning without it.
You might try reducing it to 4.7 or 2.2k if your radio will not
enter "Clone in" mode. Make sure you enable DTR on the com port.
You might also need to loop back the other handshake lines.

I suppose I should mention that this info is supplied as is. You take
the risk of smoking your radio or computer in your own hands. Good luck!

OK Here is the design --

ICOM Radio/RS232 nterface which meets RS232 specifications.

```
*-------------------------------------------------------------------------*
* This circuit has no expressed or implied warranty of any kind. *
* It works very well for my IC-735 and with three different computers. *
* It has not been used on any other Icom radio but should be compatible *
* with a number of other desktop models. *
* BUT *
* !! USE IT AT YOUR OWN RISK !! *
* D. W. Bray, K2LMG -- Clarkson University *
```

--

This design uses a chip designed to produce both the + and - voltages required
by RS232 from a single +5 volts, and incorporates two receiving and transmitting inverters which meet the RS232 specifications. The only other chip needed is a buffer which allows its output to be driven from another source.

A circuit drawing is presented below. In words, the implementation is:

ICL232 Chip -- Pin 14 is output to RS232 Pin 3; Pin 13 is input from RS232 Pin
2; Pin 11 is tied to 7417 Pin 2 and to a 270 ohm resistor, the other resistor connection is tied to +5V; Pin 12 is tied to 7417 Pin 3.

ICL232 Chip -- Capacitors. C3 + lead is tied to Pin 2, C3 - lead is tied to +5V; C1 + lead is tied to Pin 1, C1 - lead to Pin 3; C2 + lead is tied to Pin 4, C2 - lead tied to Pin 5; C4 + lead tied to GND, and
C4 - lead tied to Pin 6.

ICL232 Chip -- VCC is Pin 16 which is tied to +5V. GND Pin is 15 which is tied
to ground. All leads not mentioned should be open.

7417 Chip -- Pins 2 and 3 are tied as discussed above. Pins 1 and 4 are connected together and to the center pin of a 1/8" plug for connection to an Icom radio.

7417 Chip -- VCC is Pin 14 which is tied to +5V. GND is Pin 7 which is tied to
ground. All leads not mentioned should be open.

The ICL232 chip uses an internal oscillator to create the +- voltages by voltage doublers (which require C1 and C2). Pin 2 is a +10V source, Pin 6 is a
-10V source (but are not connect to anything is this design). The Transmitters
(Tx) and Receivers (Rx) meet RS232 specifications. One source of the ICL232 is: DigiKey Corp., Thief River Falls, MN 56701-0677 -- 1-800-344-4539. Price approximately $4.80.

The 7417 is an open collector buffer chip. This allows a buffer output to be driven from another source, and is compatible with the Icom IC-735 internal pull-up circuit. Designs which use 1488/1489 chips, where the Icom input/output lead is tied to a buffer output (in a similar manner to this circuit), violate chip specifications.

In this diagram "+" means "cross", that is, no connection; '*' means connection.

OK Here is the design --

ICOM Radio/RS232 interface which meets RS232 specifications.

```
*-------------------------------------------------------------------------*
* This circuit has no expressed or implied warranty of any kind.
*
* It works very well for my IC-735 and with three different computers.
```

```
*
* It has not been used on any other Icom radio but should be
compatible *
* with a number of other desktop models.
*
* BUT
*
* !! USE IT AT YOUR OWN RISK !!
*
* D. W. Bray, K2LMG -- Clarkson University
*
*------------------------------------------------------------------------*

This design uses a chip designed to produce both the + and - voltages
required
by RS232 from a single +5 volts, and incorporates two receiving and
transmitting inverters which meet the RS232 specifications. The only
other
chip needed is a buffer which allows its output to be driven from
another
source.

A circuit drawing is presented below. In words, the implementation is:

ICL232 Chip -- Pin 14 is output to RS232 Pin 3; Pin 13 is input from
RS232 Pin
2; Pin 11 is tied to 7417 Pin 2 and to a 270 ohm resistor,
the
other resistor connection is tied to +5V; Pin 12 is tied to
7417
Pin 3.

ICL232 Chip -- Capacitors. C3 + lead is tied to Pin 2, C3 - lead is
tied to
+5V; C1 + lead is tied to Pin 1, C1 - lead to Pin 3; C2 +
lead is
tied to Pin 4, C2 - lead tied to Pin 5; C4 + lead tied to
GND, and
C4 - lead tied to Pin 6.

ICL232 Chip -- VCC is Pin 16 which is tied to +5V. GND Pin is 15 which
is tied
to ground. All leads not mentioned should be open.

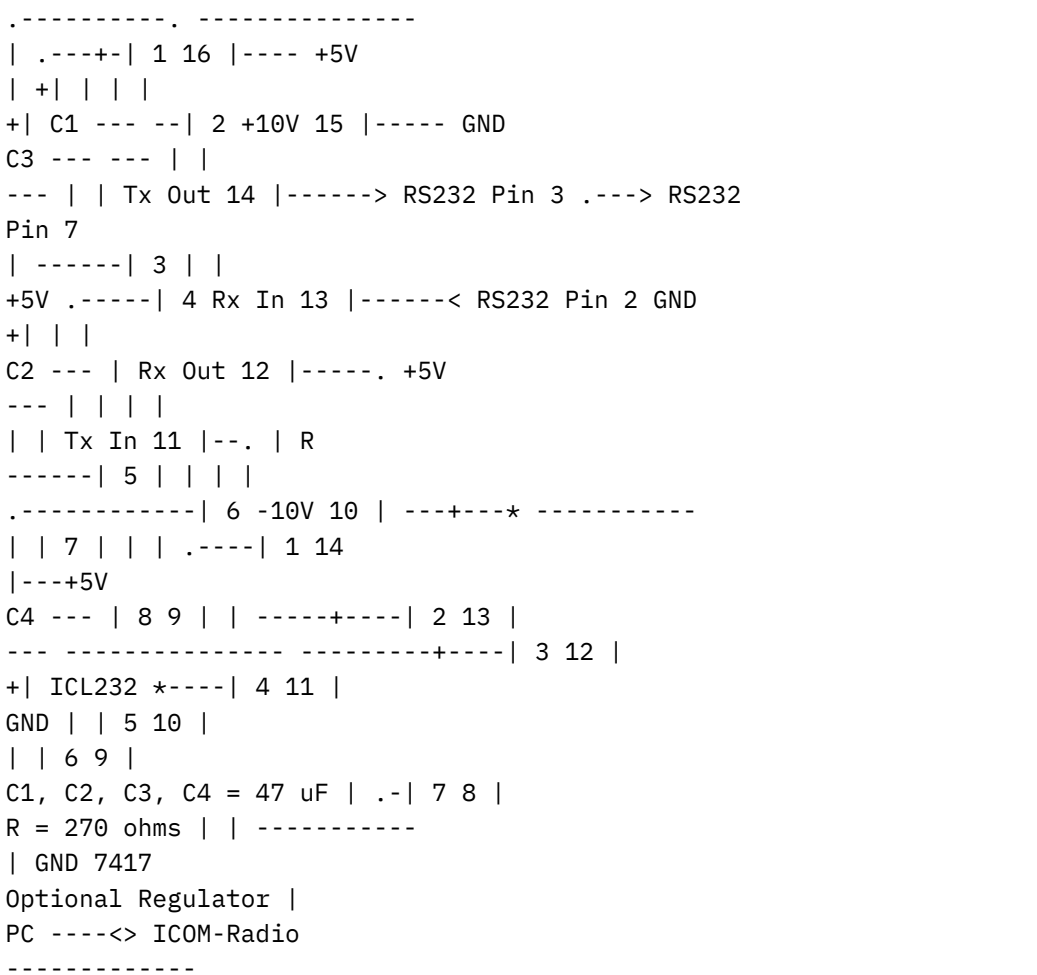
7417 Chip -- Pins 2 and 3 are tied as discussed above. Pins 1 and 4
are
connected together and to the center pin of a 1/8" plug for
connection to an Icom radio.

7417 Chip -- VCC is Pin 14 which is tied to +5V. GND is Pin 7 which is
tied to
ground. All leads not mentioned should be open.
```

The ICL232 chip uses an internal oscillator to create the +- voltages by
voltage doublers (which require C1 and C2). Pin 2 is a +10V source, Pin 6 is a
-10V source (but are not connect to anything is this design). The Transmitters
(Tx) and Receivers (Rx) meet RS232 specifications. One source of the ICL232
is: DigiKey Corp., Thief River Falls, MN 56701-0677 -- 1-800-344-4539. Price
approximately $4.80.

The 7417 is an open collector buffer chip. This allows a buffer output to be
driven from another source, and is compatible with the Icom IC-735 internal
pull-up circuit. Designs which use 1488/1489 chips, where the Icom
input/output lead is tied to a buffer output (in a similar manner to this
circuit), violate chip specifications.

In this diagram "+" means "cross", that is, no connection; '*' means
connection.



```

Hi Everybody!
My highschool seems to have developed an interest in the idea of
building an on-campus local FM radio station. So I, being a bit of a geek,
have decided to take it upon myself to attempt to compile all information
possible on the subject- what equipment is needed, what FCC liscences are
necessary, where we could possibly look for grants, etc. So, if anyone has
any useful and valid information on the subject, please reply. Thanks.
-Ian the Grate

PS Also, what is needed to pass the FCC tech test(age requirements, degrees)?

>73, Bryce, K1GAX

K1GAX huh? Howdy Bryce! Hey, I spent several years in the same USAF
at the same base in the same unit in the same area of Southern New
Mexico and at the same time as you.

Hey, I just noticed in QST that Ben, W5GYT became a silent key
recently. Used to talk to him all the time on the Eight-Oh machine as
he passed through Alamo. I think you know about Dean, W5UNK, as I
imagine you still keep in touch with some of the folk in Alamo. We'll
miss him.

N1MBV says hello. We'll have to get up to your neck of the woods
sometime. Maybe this fall.

To keep on topic, I spent six months TDY to Marana, AZ--about 27 miles
west of Tucson and was there during their monsoon season when the
arroyos became raging torrents. No thanks. Not fun.

Awhile back it was confirmed that Kenwood would indeed make the backlite
brighter for the face of the TM-V7A. All you had to do was send the head
in along with the serial number.
Has anyone had this done? How long for a turn around time, and was it
worth it?

6320. Kachina Pros and Cons of the Concept

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-24 00:00:00 UTC
From: feliccia@unix3.netaxs.com
Message-ID: <609p4a$bko@netaxs.com>
Source record: 165367

I think there are pros and cons of the Kachina concept. First one of the differences between the hobby of Ham Radio and Computers is that a 10 year old ham rig, as long as it is working still has some value and is functional. However, a 3 year old computer is basically nearly worthless and not functional in terms of modern software. I know I am writing this on a 386, but who would buy a 486 DX 2 66 [prime only 3 years ago] as a primary computer.

This leads to ham radio equipment. I can take a Ten Tec Century 21 Rig, made 20 years go, or a HW 8 or what have you from the 60's, and assuming the rig is still functional, get up and key away on the air.

However, in 20 years is anyone going to have a computer with Windows 95 or Windows 3.1 to run the Kachina software? Will the rig be able to interface with the 1 GHz Processor 1 Terabyte of memory computer? For this reason, I think that there should always be some knobs on the front of the rig.

This should start a good thread.
Nick

Hi Michael,

The subscription price has gone up a little. Please send me $150 for a six month subscription to each group, and get all your friends to do the same. I see you are interested in four groups, so that's $600. I know it seems like a lot of money, but look at all the great posts your current trial membership is bringing you. You wouldn't want to get cut off and lose all that, would you? So send the $600 today, in $10 and $20 bills. I'll credit your next six month subscription $5 for every friend you get to sign up!

Thanks,

Elmer

Message-ID: <3428A913.7B37@usa.net>
Source record: 165382

Am looking to purchase two (2) Astron RS-35M power supplies. Also have to trade a Kenwood PS-40 and/or an Astron RS-20M (old style single meter switchable volts/amps) against the 35M's.

Will listen to offers from other 30 amp or better supplies with dual meters.

The closer ya are to southwest Florida the better to save shipping. Willing to drive for good deal within 200 miles.

Thanks, and best 73,
Bill

Please contact Dave (not me) regarding the enclosed note below.
73, Jeff KH2PZ / KH6

From arc5@ix.netcom.com Sat Sep 20 17:50:11 1997
Date: Sat, 20 Sep 1997 16:43:18 -1000
From: arc5@ix.netcom.com
To: Old Tube Radios <boatanchors@theporch.com>
Subject: ATTENTION RTTY PEOPLE

(Please copy this to any RTTY reflectors or lists)

A very large lot of RTTY gear (enough to fill a
small flatbed trailer), including boxed T-117s,
loose Model 14s, 19s, 15s and some I've never heard of
and many different loop supplies, test sets,
accessories, spare parts kits, adjustment tools etc.
are in danger of going in the dump in Houston, Texas.
It needs to be saved if possible.
They are part of a large estate sale.
The person running the sale is honest
and the prices are very reasonable.

If you are interested *and* you are willing to put in some
hot, dirty, sore-muscle time in digging this stuff out,
then send me email before Tuesday (Sept 23) and I'll
send you contact information.

Bring loose, cool clothing, plenty to drink and
a *good attitude.* Greedy-Grabbers and aggresive,
rude people will be shown the door at once.

>I'm am desperately looking for modifications on Kenwood TS 780 VHF/UHF all
>mode base rig!
>
>I want to:
>
>- Extend the RX range (want to be able to receive around 150 MHz)

NOT ADVISED - One of the advantages of the TS780 is that it was designed
to receive signals within the ham bands only. Extending the receive
coverage wiuld give you problems from break through of out of band
signals (pagers etc.)

>- Improve RX sensibility (is quite OK but if possible better RX would be
>nice)

Use an external mast head pre-amp.

>- Pump up the HF power if possible (is now 10 watt, I've heard that 3dB
>gain is possible)

Specification is 12 watts. 17 watts is possible but again not advised.
The difference is not going to be worth the risk of running out of spec.
If you must "have a go", remove the top cover and locate the TX board.
(second board from heatsink) VR1 adjusts the high power setting on 144
and VR2 adjusts the high power setting on UHF.

>- Setup the Signal meter properly (The needle's a bit heavy.. hi)

Setting up the signal meter properly involves a number of adjustments
and should not be tackled without a service manual. If you just want to
see a more active "S" meter the pre amp will do that for you.

>- Change the "low power" settings (should be 1 watt, is now 180 mW)

VR4 on the 430 final board (next to the heatsink) controls low power on
VHF. VR5 on the same board controls low power on UHF.

>- Built in CTCSS (To open "modern" repeaters)

Boards or kits should be available from most good dealers.
>
>The Kenwood TS 780 is a 80's VHF/UHF set, please be so kind to review your

>"old" docs and help a just started Dutch HAM friend out!
>
>Thanks in advance!
>
>Pleun (PD1ADI locator JO21WT)
>
Nice to see you want to "have a go" but don't rush in where others fear to tread! You have an excellent base station and it is all too easy to adjust the incorrect component if you don't have a service manual. Good luck and look forward to working you soon.

if you have the radio set to use the UP / Down buttons for CW then
they no longer work for the traditional UP / Down operation. Set the
mode to CW go into the quick set mode and look at the CW paddle
setting. It should not be ud.

And purchase what? Or did they pick up a new dual-bander to replace the
one they yanked from the market?

Let's look at the requirements. Right off the bat, I would guess that you had
a bad experience with the FT-50R (SMA, oddball speaker/mic connector,
kind of hard to fit a Radio Shack part in the power jack). Maybe not.

As far as I can tell, I think you could go with:
Icom IC-T7A [programmable]
Icom IC-W32A [clone & program]
Yaesu FT-51R [clone & program]

All are dual-band, appear to have BNCs, should handle 13.8 volts on a
reasonably common connector, should take standard speaker/mics,
have AA-packs available, should have wide Rx, are cloneable and/or
programmable, and are new enough that they should be around for
another year or two (though Icom seems to kill their models fast lately).

A G5RV doesn't have traps. Some use a balun at the twinlead to coax interface.
Maybe that's what you mean. Just goop it up with RTV or some other sealer
and forget about it. Or better, dispense with it altogether and just run the
balanced line to the tuner in the shack.

The rig interface is a RS232 serial link. I suppose that may become obsolete
some day, but it should be pretty easy to simulate it by bit banging any line
available on the 1 GHz machine, or building a simple converter box to/from
USB or firewire (comparable to generating a current loop from RS232 is today,
likely a single chip solution given the chips which will be available then).
The Kachina rig isn't like a Winradio, it doesn't depend on a particular
buss structure or computer architecture.

And with the enormous amount of DOS and Windows software out there,
I expect there will still be an emulator available on your super computer to run
it. Though if Kachina stays in business, they'll just recompile the source to
run under whatever new OS or GUI that becomes popular. And they publish
the API anyway, so you can always write your own control software. That
should be a breeze with the 9th generation software development systems that
should be appearing on your super computer by then.

Source record: 165402

The full break-in on the IC-706 works poorly at best (at least in comparison to Ten Tec Rigs). It lightens the code elements so much that the CW sounds very choppy. Their weight control, as they call it, is really a ratio control and if used to make the code heavier, it instead makes it sound funny (dot to dash ratio off). I'm talking about using the internal keyer here. I could probably improve the QSK by using an external keyer set very heavy.

The semi QSK works OK. I think ICOM improved the QSK in the MK II. Does anyone have any info on how to make the QSK in the 706 work better short of trading it in on another rig?

E-mail responses preferred but if you have an answer I'll take it any way I can get it!

73,
Puck, W4PM

6356. ICOM-706 users: HELP, please ..

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-24 00:00:00 UTC
From: zygo@azstarnet.com
Message-ID: <zygo-2409971007090001@dialup17ip34.tus.azstarnet.com>
Source record: 165403

I'm in discussions with a vendor from whom I've purchased a new 706 Mk II. I sent it back because it seemed not to have proper audio drive. They say it works "just like the one we have on display here" and that nothing seems to be wrong.

My "symptoms" were: (following all operating into a dummy 50-ohm load)

In SSB mode, VOX off, no compression, with mike gain levels of from 5 to 9 or even 10 normal speech at normal mike distance does not produce any ALC indication on the display. Practically shouting at higher mike gains finally gives a first or second segment indication. Going to compression makes a difference: I do then get ALC indication into the middle of the range.

Question: Is this "normal" or not? My reading of the instruction book indicated that I should have been seeing ALC indication into at least the middle of the range with normal speech and gain level, and that by raising to gain I should have been able to drive the ALC to the end ....

I did not actually try the rig on the air (which I realize now was a mistake ....)

Any quick comments would be welcome, as I don't know anyone locally who has this rig for comparison.

Thanks, Jim W7JIT (Tucson, AZ)

6357. Help me ID TENTEC Rig

Newsgroup: rec.radio.amateur.equipment

Source record: 165404

About 6 - 8 years ago I used another Hams TenTec Rig but can't remember what model it was. It covered 80M through 10M CW and SSB. It produced about 50 watts output and had a digital frequency display. It also had a noise blanker and a CW filter installed. It was not a Century 21.
If anyone can help me ID this I would be thankful.

Maybe Argosy ???

Anyone have a picture of this rig.

Thanks
jp

From: Robert Lyons <boblyons@umich.edu>
Message-ID: <34294FBE.6244@umich.edu>
Source record: 165407

The 2M yagi I'm building would work best with a rotor, and someday I'd like to have an HF yagi as well, perhaps mounted on the same mast and using the same rotor. Problem is, I know nothing about rotors and how to choose/size them. Can someone instruct me on "wind load" ratings, maybe how to estimate them for a home-brew beam? Also helpful would be typical prices for single-axis rotors, recommended manufacturers/sources, and any other "do" and "don't" rules of thumb.

Thanks for any info.

Not to nitpick, but if it has a balun, it's not a "true" G5RV. Read Lou Varney's (G5RV) explanation of the antenna in the ARRL Antenna Compendium. The G5RV uses no matching device between the coax and the ladder line.

Ok...ok. Enough flames in my mailbox. Sorry to all you poor 7-land
hams who are going to be knee deep in water shortly. Here are my
top 10 ways to ride out a typhoon (or tropical storm, or hurricane
for you folks in the Atlantic):

10. watch reruns of Giligans Island
09. bail the basement as it fills up.
08. no power? no problem...charge up that HT and listen to the
old timers talk about the _REAL_ storm of '52 on the local
repeater.
...hello? is this thing on??? Hellooooooo?
07. Stand outside in the rain with the HT and arm extended (a-la
statue of liberty) to see if you can still
hit the local repeater with all the rain.
06. Play with the fuse-box to make the kids think the power's out.
05. Call up Domino's and order a couple supremes...then
watch as the driver gets a "drink from a fire hose" trying
to get the pizza to your door in 30 or less.
04. couple cold beers (cooler and ice in case the AC goes out)
03. cuban cigar (monte cristo, fonseco, cohiba all ok)
02. put up that new 7 element yagi -- sure to work FB in good WX if
it works in the rain
01. track the storm with the help of your skywarn buddy on the
local repeater. But, you have to wear the baseball cap with
the tornado/eyeball thingy on the front to qualify. (hiding
under the shack table really helps)....

Remember, dont talk on the radio when you're ankles are submerged unless
you want a new hair-doo. People float, antennas dont.
Here are some cool tyhpoon / tropical storm web pages for tracking
the big kahunas:

http://www.solar.ifa.hawaii.edu/Tropical/tropical.html
http://iwin.nws.noaa.gov/iwin/us/hurricane.html
http://www.npmocw.navy.mil/npmocw/prods/jtwc.html

How's dat fer service.
Later,
Joe

Listening to the radio (FT-1000D) right now. What a difference with the 59Y. It's going to take some learning (programming) but it's a versatile little jewel. Listening to a cw sig on 7029 right now, no noise around him--just his sig and that's it...and I'm wearing headphones BTW.

To answer your question....I was sold on it before I bought it. I like it.

This is certainly normal for the IC706, and I suppose for the Mk II as well.
What you are calling "normal mike distance" is the real issue. You have to
close talk the supplied Icom mike, I mean *really* close talk it. That's a
feature, not a bug, because it tends to reject road noise in a mobile setup.
You also have to speak up with some authority, and again that helps against
road noise. If you are used to "pin drop" response, you won't be happy
with this setup. Switch to an amplified mike if this is the case, but don't
even think of taking it mobile.

I disagree. One of our cacti (opuntia robusta) had a bumper crop
of fruit this year and they are very tasty. Sliced and served
plain or with ice cream is good, as are slices in Jello. The
innermost portion, after straining the seeds, makes a very sweet and
tasty sauce. This sauce is good over ice cream and other desserts.

Actually, G5RV has advocated eliminating the coax too. That makes it a special case of the ordinary Hertzian flattop, which is an excellent multi-band antenna.

W9FL & Jim-

My old 706 is that way too. It may be "normal", in that they all are that way, but it isn't right! My 706 just doesn't have sufficient RF drive when set for full output. I had hoped they fixed the problem in the MK-II, but I guess they didn't.

This isn't caused by low microphone gain, as some have suggested. If you turn microphone gain all the way up and yell or whistle, you still only get a mid-range reading of ALC, and the audio gets mushy. Obviously, there is sufficient microphone gain to saturate the audio amplifier.

I found that ALC action increased noticeably when I turned down the power level.

6385. Question: VX-1R Mods

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-25 00:00:00 UTC
From: dew@gray.cb.att.com
Message-ID: <60emiv$gme@nntpa.cb.lucent.com>
Source record: 165327

I never got my question answered on the
VX-1R, so I will try again.

Can the mod to open up cellular on rcv be
made without making the mod to open up xmit?
Since there are two sets of pads involved I
was hoping to only make the rcv mod and
maybe keep the ARS option operational.
Anyone know if that would work?

>or other similar devices in conjunction with a Heil HC4 and an ICOM 736?

I can't offer anything directly related to the noise gate/equalizer.

I use a Heil Pro set headset with boom Mic with the HC-4 element. I
use it with and without "processing" on the TS-450 transceiver and
with and without "compression" on the IC-751A transceiver. The HC-4
element seems to offer primarily a higher low frequency cuttoff.
I.e., there are less lows in my audio. The speech compression or
processing seems to do very little other than raise the background
noise from the shack between words, so I use it seldom.

As far as I've been able to determine, an external keyer is the only answer.
The internal "keyer" is just firmware in the main uP, and you can't get to
that to change it. When you key the rig externally, the weighting seems to
be Ok.

Dear friends,
I have problem with Alinco DR-130 VHF mobile.I could not exit
from its Channel mode.I look in modifications archive on net and I
found that I must hold VFO/M key and press on button but nothing
happens.When I try to reset station it stays the same,it locks on
Channel mode.Tranceiver is not locked,all keys works(I check).
Because it have been before in proffesional use iis it possible to
somehow lock VFO mode.On PCB I foynd two cut wires (blue and red)
I try all resets with combination with wires soldered or nor but
nothing happens.I noticed 24L02 EEprom inside.Is there some global
reset for DR-130 or other way
Thank You for help
Sacha

Well, as of 01:00 UTC (6:00 PM MST) the "big storm" has fizzled here in the Phoenix area, at least the southeast part of the metro area. Had a little sprinkle a couple hours ago but it didn't even settle the dust. In fact, the wind is kicking up a dust storm. Very underwhelming. I guess the western part of the state is getting it worse.

OTOH, one to two inches of rain in a short time can wreak havoc in the desert. We get only about 6 inches a year (even less farther south). The ground can't absorb it and it runs off into the washes and can be pretty damaging. And there's always a few doofusses (doofii?) who think they can drive thru it.

So much for the wx report...

I started this when I replied about missing K-town. We need to get all the folks on the net who were in the K-town area and email each other.

BTW, Sembach does not have aircraft working out of it. It is used as a secondary site. Some of the old hangers are being used as commercial go cart racing. It is great fun!! (So much easier to have recreational activities when the lawyers are kept at bay.)

Sounds like a 525D (Argosy II). I just sold one a few months ago.
It had the matching power supply, noise blanker, CW filter, audio
filter, etc. Fully loaded! Nice little rig. I sold it to a new
general, and he's loving it! Power output was about 50 watts CW.

6403. FT-101-ZD questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-25 00:00:00 UTC
From: "Dennis L. Wade" <wade@mpu.com>
Message-ID: <342B3369.5DED@mpu.com>
Source record: 165345
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

I was recently presented with an opportunity to purchase the above named piece of equipment with a speaker/phone patch unit.

The addition of 160 and WARC bands to my station is very attractive; my Tempo 1 is only 80-10, no WARC.

My questions for you are as follows:

1. Does this qualify as a Vintage Solid State (VSS) piece (I understand it uses 6146's in the final)? In other words, can I troubleshoot and repair it in my home
shop, no weird chips/other parts that I can't replace, other elements of a
VSS piece?.I have to be able to fix the thing when/if it dies.

2. General reliability of the unit. Does it die easily? Common failure modes?

3. Quality of the receiver. How does it perform on CW (my primary mode)? I understand Fox-Tango offered upgrade filters for the unit, are these necessary for a decent CW receiver?

4. And finally, range of values for units in good to excellent condition?

Thanks for your input!

73, Dennis

--

If you wish to email me, please remove the letters "cq" from the start
of my email. (I put the letters "cq" so that the automatic email SPAM
programs will get the wrong address.) :-)

Less than a week ago I purchased an Icom IC-T2A 2M HT. Overall, I'm
very happy with the unit, except for one problem that's really odd.

When I transmit the Audio is muffeled and weak. One friend said, "It
sounds like I have a bucket over my head!" I went back to HRO (where
I purchased the unit) and guess what, 2 other units in the store sound
exactly the same. (The sound from a Yaesu was chrisp and clear.)

By the way, while the people at HRO couldn't solve the problem, they
were VERY helpful and did take the time with me to try different things.

In testing the Icom IC-T2A at home, I plugged a Radio Shack Speaker/Mike
into the unit and re-tested the unit. With the RS Mike, the audio was
clean and clear! . . . Interesting!

I own several differet ham radios, Radio Shack, Alinco, Standard, and
Icom; however the Icom is the only unit with muffeled sound when I
transmit from the built in mike. (Very odd)

I plan on calling Icom about this and I'll post an update regarding this
issue, but until then:

Are there any other Icom IC-T2A users out there that have seen this
problem?

Are there other IC-T2A users out there who don't have this problem?

73,

Bob

The so-called trap is probably the pvc tube that is sometimes used to
enclose the transition from twinlead to coax. I have purchased at
least 3 and built one from scratch, and there are no traps and no
baluns used in any G5RV design that I know about.

>

Hello, folks, but SHOULDN'T the ALC read low, if at all, under normal
circumstances? The only time the Automatic Level Control should take
control of the rig's modulation is when TOO MUCH is applied. The ALC
cuts back the gain to avoid splatter. A side effect can be "mushy"
audio.

So, yes, little or no ALC is fine. A little indication on voice peaks
means you're set up close to perfectly.

I'm not trying to be difficult, but many people might read this thread
and be led to believe that the only way an SSB transmitter is properly
adjusted is when the ALC meter is waving all over the place. It isn't.

Brian,

Actually, I think the experiences WM7D is having with
his 920 should be read as a "caution sign" for anyone
thinking of buying one. Is it not about to be sent
back to Yaesu for the second time??

I purchased one recently and returned it promptly
because of problems I encounter. I outlined the
problems and sent them to WM7D a few days
ago. So far he has not included them on his Web
page.

Regards,

Paul, W2CW

Hehehe! Well, when I left Sembach I went to Patrick AFB, Fl....to the
2nd MOB.....2nd Combat Comm Gp to be exact (1977-1981). Talk about
small world! I lived off base in Gollheim (With two dots over the
"o") out toward Eisenburg and under Donnersberg, and then moved into
base housing at Vogelweh-->2731 Apt N. Can't believe I still remember
that. Different life....different wife.

Hi,

Can anyone tell me an easy way (without purchasing expensive/heavy
equipment),
how to interfere with a range of frequencies - say with a set of stage
radio
microphones all tuned fairly close together ? Is there some device
(like electric
beaters) or perhaps something less noisy that will screw with everything
in nearby
air ?

Please send me email if you can help,

Adrian.

You're in luck. I happen to be the inventor of the "llamalater". It
is a coin-sized whistle that, when you blow in it, emits approximately
1KW of power in ALL BANDS. It sounds like "tweeeeeeet", so you will
not be suspicious at all.

You can purchase this device for only $49.95.

Interested?

Jimbly

6423. VX-1R Tone Squelch Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-26 00:00:00 UTC
From: markcamp@atl.mindspring.com
Message-ID: <342bb8de.2177485@news.atl.mindspring.com>
Source record: 165221

I have discovered that after making the mods to my VX-1R, one other feature that does not seem to work is the function of the bell ringing if someone opens up Tone Squelch. Am I doing something wrong? The tone squelch function definitely works tho because unless the transmitting station is using the proper PL tone, you can't hear them. However, the book says that if you have the bell set for 1/3/5/8 or repeating rings, the bell will sound and the little bell icon will flash. This does not happen on mine. Has anyone else experienced this?

There is another reason (aside from legalities and technical difficulties) why you would want to have a real aviation H-T instead of a hacked ham transceiver.

During my student pilot days, one of the reasons I was using my Icom A21 aviation H-T (aside from a few equipment outages) was to give me extra equipment in lesser-equipped aircraft. For example, for Class D airspace VFR operations, you are only required to have communications equipment to remain in contact with ATC; the regs do not require dual radios (as IFR-rated aircraft are equipped). As such, to save money, my flight school only had one radio in each of the primary VFR trainers (Cessna 152's). It was extremely nice to have two NAV receivers while on long cross-country flights, because then I didn't have to keep switching the panel radio between two VOR's to get a cross-fix; I could just tune in one VOR (usually the straight-ahead one) on the panel radio, and the other VOR on the H-T, and use the NAV readouts to figure my position, without having to memorize the radial from one VOR while I was monitoring the other VOR (as you would have to do with only one NAV receiver). As a student pilot, _anything_ that reduced or streamlined my cockpit workload was worth it, because I wasn't yet experienced enough to deal with surprises on top of the normal amount of work required for single-pilot cross-country flight. If you have started your solo cross-country flights, you will know what I mean about workload. :-)

I don't know of _any_ ham gear that can decode and display VOR navigation data.

Besides, why would you be carrying around two radios? As a student pilot, you're going to be too busy flying the airplane, navigating, and talking with ATC to have much spare time to chat on the ham bands. I've had my private pilot's certificate for two years now, and I still find that I haven't had time to switch on the ham H-T while in flight yet, even when I do carry it on board. And, soon, I won't be able to use it on board anyway, because I'm (finally) starting instrument training, and the FAR's and FCC Part 97 both specify no operating amateur radio transmitters on board an IFR flight, even with PIC approval.

I have a Uniden 2510 FS or trade. Covers 26 - 30 mhz, stock mic, mounting bracket, power cord and manual. $200 plus shipping or trade to a 2 meter radio, handheld or mobile.

Galaxy DX55V, new, 240 channels, am/fm, freq display, mic, manual and maounting bracket. $150 plus shipping or trade to Radio Shack HTX-202 with accessories.

GE-5811B 40 channel, un-modified, no mic, bracket, or manual. $25 plus shipping.

Browning Eagle R27 receiver, S23 transmitter with Sams. $200 plus shipping or trade to 2 meter mobile or handheld.

Yikes, I have never heard, and know no basis for such a claim.

>and second, where would I get replacements for such an old radio?

You really don't need replacements, but if you want "sharper"
filtering, you can get narrower filters for the 520, I believe.
It is not always as pleasant to listen to, though, there is a
tradeoff in the very sharpest of filters for SSB. For CW,
go as narrow as you like, it just takes more tuning finesse
as you get it down to the 250 Hz range.

Look up International Radio, they used to list filters for the 520,
and they are now up in Oregon.

Bob-

Filters losing their sharpness, is not a common failure mode. While a rare crystal might drift with age, you shouldn't replace an old filter as a preventative measure. Wait for the failure to occur, and then fix it.

I have found a more common problem with the upper and lower sideband carrier oscillator crystals drifting. The result is a difference in the way noise sounds when switching between sidebands, as if the IF shift control wasn't centered. This can usually be adjusted, unless it is beyond the range of the crystal's calibration capacitor.

If a crystal filter did "age", I would expect the result to be similar to the carrier crystal drift, rather than a loss of sharpness.

> means you're set up close to perfectly.

George-

Your view is appropriate for a broadcast situation, where little clipping
or compression is tolerated.

From my view, a Ham SSB station is used for communications over a noisy
channel. Speech has peaks that are 10 or more DB above the average
level. Therefore, the IC-706 average signal is 10 watts or less, when
peaks are just strong enough to reach the ALC threshold.

I think "ideal" is where peaks stay consistently in the ALC meter scale's
"good" region, but occasionally may exceed it. This is the way other rigs
work, and it is the way the manual says the IC-706 should work without
turning on the compression function.

As a result, the IC-706 has a high quality, but wimpy signal!

Band edge beep is a feature that can be enabled or disabled. Maybe yours is
off.
Hold the "Lock" button on when you turn on the 706 then check that
parameter 2 (band beep) is turned on.

Although you don't mention if you want base, mobile, or handheld, For my
two cents worth I bought an ICOM 207H, selling new for $389.00 - 45 watts
on 2 meter, 35 watts on 440. Radio is great, cannot monitor both bands at
once or have cross band repeating, but is all set up for packet, if so desired.
It was fairly easy to convert to receive military and 800 MHz bands.

Good luck buying a radio!

Having made the foolish mistake of sending certified mail...

It takes on average 20 days for a piece of certified mail
to reach its destination. This was not appreciated by my
mortgage company.

My wife and I arrived at this time by purposely send certified
mail 10 times to the same Florida address. The range for delivery
dates ran from 15 days to 37 days, elapsed days not business days.
The post office claims 7-10 business days. We presented this
information to the postmaster here in Raleigh, and he said he
would look into it. That was 1 year ago.

In the future have people send you money via 2 day mail.
It costs less and it gets to you a lot quicker.

Brian

Hi,
I bought a VX-1R yesterday and am having a couple of problems with it.
I saw a post about how to get it to recieve on vhf and transmit on uhf,
but I haven't been able to get it to work. Anyone else have any luck?

Another problem is that I was able to mask one memory, but I haven't
been able to mask any more.

Also, I saw a post that stated that his firmware level was A105. How do
I find out my firmware level?

Does anyone know if the firmware is in flash memory and if it can be
upgraded by the new ADMS program when it comes out? Or any other way?

Thanks in advance,
Jim McGhee N5FZT

Interesting, I'll need to take a real close look at the unit to see.

I called Icom's Technical Support Department today. The person I
spoke to told me, "I've never heard of that problem." I bet I was
the 10,000 person that've said that to. <smile>

I understand that a company never wants to admit to making a mistake;
still it would have been nice if they gave me a little more useful
information.

I received an email regarding this:

<<start email quote>>

Hi There. I have fixed a couple for people localy. What you have to do is
open up the radio, and drill a small hole (1/32" seems to work ok) into
the front panel of the radio, where the small 1/4" holder for the electret
mic cartrage is. It will wind up inside of one of the holes on the
front panel. Next thing to do, is use a little hot glue to seal off the
small grove that goes out the side of the mic holder. The problem is that
ICOM tried to use the holes for the speaker for the mic as well, and you
wind up with a transmit audio that sounds like you are talking to a barrel,
because you voice is echoing around inside the radio cavity behind the
speaker. The small hole gives a direct route for the sound to the mic
cartrage, rather than thru the little grove, that comes in thru the speaker
grill. Closing off the grove, eliminates the hollow sound.

ICOM has done this same stupid thing with a couple other radios in the
past, you would think they would have learned by now.

<<end email quote>>

So, it appears that Icom has a minor design problem in their IC-T2A HT.
However, it can be corrected.

73,

KF6JHG (Bob)

I have a Kenwood TS870 that came without the control software from
Kenwood.
If anyone has this software, I would appreciate it if they could send it
to me via e-mail.

Thanks in advance,
Jim N5JIM

[snipped]

Roger:

I'm sorry you had the unfortunate experience with the TH79A transaction which went sour.
I've made several transactions via the internet ... most, but not all, with hams. Everything has been as agreed upon. With the large numbers of transactions occurring, it is inevitable that some transactions will fail for various reasons.

You have some options available. In hope of helping you and other hams who have distasteful experiences with failed Internet deals, here are some suggestions. Try them and see which of them offer you some hope of getting some positive results.

1) Contact your state's Attorney General's Office. Ask for the Consumer Protection Division. Since you reside in NY, you should go to the NY Attorney General's WWW site:

http://www.oag.state.ny.us

Then, take a peek at:

http://www.oag.state.ny.us/press/sep97/sep23_97.html

and read the last sentence in the news release. After reading the news release and looking at the home page, you should have additional ideas about which steps to take next within NY State. As I see it, the NY AG wants to stop Internet crime. I think your failed deal, why obviously not a widespread matter, may warrant involvement by a member of his staff.

2) Contact your local post office and ask for the number of the Postal Inspector with jurisdication for your community. The message trail you've accumulated would be very helpful. It is a violation of the U.S. Code to use telephone circuits to commit a crime. Furthermore, it is a violation of U.S. Code to use the U.S. mail to do the same thing. You probably won't get the FBI interested in your failed transaction, but I imagine you may find some sympathy if you connect with an interested

Postal Inspector.

If you haven't already done so, check to see if your software will display the headers of the various messages you received. If it does, print the messages individually with the headers so you can use them to help substantiate that you didn't make up the messages (or edit them) in the event that your are later challenged.

3) Contact the U.S. Attorney's Office for your area of NY State. Ask to speak to an Assistant U.S. Attorney General or make a telephone appointment for one to contact you.
Explain what has occurred and see if there is any assistance which you can receive.

4) Contact your local "small claims" court and see if you can file an action with regard to this matter.

I hope these suggestions help you. It is unfortunate that you were apparently stiffed by a fellow ham. If things are as you stated in your lengthy and detailed message, you have been a victim of a very unfortunate Internet transaction.

Message-ID: <342C724F.18AC@pacbell.net>
Source record: 165252

Read your trials and tribulations.

Sort of hard as it does NOT come across as HTML when I see it in the newsgroups, but I DID read it all around the control codes.

I then went to my own personal "Black List" that I've kept from postings such as yours. I decided NOT to deal with any of those people. Just names (if given) and call letters and I discover KB8WTR as the second entry. It's likely from more than a year ago.

I must have got it off Packet rather than off Internet and a search in DejaNews doesn't produce anything when I look for KB8WTR.

Obviously, at least one other person was feeling that he had ripped them off!

Hope you are able to get this resolved. I always try to use UPS COD and pay the COD charges for the sender. Of course, I can get a box of bricks, but at least I have something...

It's NOT like the old days when hams could be trusted!

6455. Re: TS-570S vs. FT-920

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-26 00:00:00 UTC
From: Paul Reynolds <w2cw@bellsouth.net>
Message-ID: <60gfco$7sp$1@news.rdu.bellsouth.net>
Source record: 165253

Brian,

I had a FT920 for several days. It had several
problems. I returned it for another Yaesu model.
My advise is to be cautious before laying down the
money. It is hard to determine if many of the radios
have problems which I attribute to either early
production units or poor quality control at Yaesu.

Perhaps they rushed this model out for marketing
reasons. Please read wm7d web page regarding
his experience with the radio. "wm7d@wm7d.net".
His radio is going back to Yaesu for the second time.
Fortunately, he lives in California and a
return does not take as long as a return from
the east coast. I found another fellow who returned
his FT920 because of trouble with the antenna turner.

Be cautious.

Regards,

p.s. I have been a Yaesu buyer for over 20 years
and like their equipment.

I've popped into this group at times. Recently I made some followup comments and recieved several e-mail responses. The e-mail was a good exchange but I think it misses a key point. A news group needs to have the topics continued in an open thread so that people can follow a discussion and be encouraged to participate. Taking a discussion "off-line" ends it after the two parties have an exchange or two. Groups are open forums where the dynamics of discussion and debate keeps the fires burning (bad metaphor :-)

>antennae?
>
>
>Larry
>K8SRH

I've been using the JPS ANC-4 for a few days. It eliminates most of the noise from my Sony monitor using the built-in whip (it really does attenuate the noise 40 - 50dB but the monitor noise is over 50 dB). Enough so I can copy RTTY where before all I had was the monitor harmonic on the 20M RTTY sub-band. So far I've not been as successful with outside noise. A small, low dipole was installed outdoors per the instructions as a "noise antenna." It eliminates some noise on some bands. It appears to be very critical in tuning. I'll probably need to play with the dipole until it does a better job of picking up the noise. It's an expensive cure if all it does is eliminate the computer problem but still a lot cheaper than replacing a 17" monitor. I hope to tweak the system until it also handles the outside local noise. BTW, "local noise" is the key phrase. It does nothing for atmospheric noise that DSPs handle. Powerline, computer and other locally generated noise is the design target.

From: wf3h@enter.netxx
Message-ID: <342b265c.1421541@news.enter.net>
Source record: 165358

Alright the IC775DSP is on the way so the 761 has to go...This rig has built in :

-antenna tuner
-CW keyer
-power supply

and has quadruple conversion circuitry, new VCO, keypad entry, pass band tuning, and LOTS of other bells and whistles. As a bonus , I'll toss in FREE my Timewave DSP-9 unit. this has filters for SSB, CW (down to 100Hz!), eliminates white noise, heterodynes, etc.

This is a great upgrade for the current IC 735/kenwood440 user wishing to get into a SERIOUS radio with GREAT performance at a GREAT price. Asking $960 OBO + s/h. Call Bob/WF3H at 610-261-9137 or email wf3h@enter.net. Will be in next ham radio trader so if interested act now!!!

Hum can be introduced via a filament-cathode short on any tube in the
signal chain. This introduces 60 hz ac onto the signal.

6481. Key-in frequency for receive on FT-51

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-27 00:00:00 UTC
From: Steve & Evie <etse@ma.ultranet.com>
Message-ID: <342C8501.3E9B@ma.ultranet.com>
Source record: 165166

Hello.
I have a Yaesu FT-51 that I've modified for expanded receive but I've found that the only way I can receive a police/fire frequency is if I use my computer and download the frequencies. But then I'm locked into the frequencies I've downloaded. I'm not able to key in an arbitrary non-ham frequency; when I do, it's ignored.

This is especially frustrating if I've keyed in 470.41 and realize the frequency is really 470.415; I have to go back to the computer!

I know other radios allow this because I'm able to do it on a FT-530.

Does anyone know if you can, and how to, get the FT-51 so it will accept non-ham frequencies that I key in from the keyboard?

Thanks.
Steve

(Maybe I should just sell the FT-51 and get a FT-50? What will I lose/gain by doing this?)
(BTW--This is my first newsgroup posting!!)

I work with an amateur theatre group who have been experiencing weird problems sometimes, but only when the show's are being performed to the public. I am investigating whether it could be one of our audience members
with some device.

I didn't expect people to jump to the conclusion that I was out to cause any
trouble. I would think anyone who uses their real name, email address and posts
messages to rec.radio.scanner as apposed to `MrAnarchy' posting to alt.terrorist is asking an innocent question.

Source record: 165172

As an added query in this thread:-

Are there any such devices made which will work on VHF?

I have the misfortune to live next door to a very noisy tv.

The timebase whacks out a large amount of broadband hash / hum through 20 to 30m but I'm 90+ percent certain that it is also emiting spurious signals on 2m. I think it's the processor for teletext reception as I can pick up similar sigs from my own tv but they are very much weaker and can only be detected at a range of a couple of feet away.

The tv next door is a good 20ft away as the properties are detached and it appears to be radiated and not mains borne as I still get it if I run my rigs from a battery.

The TH-79ADH is a good choice! It is a true dual band radio with dual IF. It is very easy to use, especially with the menu system and guide function. The guide function allows you to look up instructions for various features of the radio. The alpa-numeric memory helps identify the channels. This radio has 7 digit naming, where other radios may have only 6, the dot matrix display gives it a nice display resolution.

Cross-band repeat, wireless control, MARS/CAP modifiable and feels good in the palm of your hand.

Kenwood is offering an instant coupon for $30.00 off the dealers price, but most dealers already quote the discount in their pricing.

6498. IF Notch Filter

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-27 00:00:00 UTC
From: Stewart Baker <baker@nildram.co.uk>
Message-ID: <342D0A57.6D03@nildram.co.uk>
Source record: 165183

I have a much modified TS180S. The only thing I feel is lacking on the RX side is an IF notch filter. The audio filter I have is OK, but it is not in the AGC loop so strong signals are a problem.

The IF of the 180 is 8MHz so I would convert down to either 50kHz or 455kHz and implement the notch there.

I have not had any success with the mags and books I have in finding ideas and circuits.

Can anybody help me, perhaps with details of how a commercial rig does it.

Thanks

Stewart G3RXQ

Right, Gary -- and, due to a redesign, it is even more pronounced on the MkII. I have one, and it works great. But very little ALC motion without compression.

Problem is that they did not mod the manual, so the manual gives wrong info on how much ALC motion you should go for.

Yaesu experts....

I have recently acquired FTdx-560 in very good condition.

The only problem is LOUD hum on speaker or headphones. Signal overrides hum when antenna is connected but hum is loud and occurs even when af gain is nearly at minimum.

Suspect electrolytics C268 or C270 in cathodes of audio amp (6BM8). Haven't replaced the tube yet, but anyone have any experience with this problem?

Thanks for the help. Bob Bacharach, WA2EMF, bobbach@cetlink.net

From: ham@cybercomm.net
Message-ID: <342d0f32.592776@news.cybercomm.net>
Source record: 165193

I need a new tribander. I consider Cushcraft like MFJ, and stay away.
I am considering the TA33 and the HyGain TH3MK3. It appears that the
Mosley puts both traps (per element end) in one enclosure. This seems
to me that it would add some rigidity to the antenna. Anyone have any
opinions??? Also, don't want the weight of a KT34 type antenna.

My recommendation is to determine how much money you are willing to lose. Anything over that you should use an Internet Broker like :

http://www.tradesafe.com

You can get both parties to agree on who will initiate the trade and pay the broker's fee. The fees are reasonable considering the comfort level they provide.

6521. For Sale 440 Mhz Repeater

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-27 00:00:00 UTC
From: gerryc@airmail.net
Message-ID: <D9289152C66ADB98.18AE7E43FAF9CC19.D411024B68251140@library-proxy.airnews.net>
Source record: 165206

Hello,

The Garland Amateur Radio Club (GARC) received as a donation some time ago two complete Motorola 450 Mhz Commericial band repeaters. They can be tuned into the 440 Mhz amateur band. These are the low band UHF models rather than the high band UHF model. The low band model can be easily tuned into the amateur band.

Because the 440 frequencies are getting hard to come by in the Dallas Area, we now have for sale one of these Motorola Repeaters.

A complete repeater consists of a Transmitter Cabinet and a Receiver Cabinet. The receiver cabinet has two multi channel receiver decks. The transmitter has a tube final but is otherwise solid state

Each completly enclosed cabinet measures 22" by 23" by 5'10". Power requirments are 110Vac. I do not have any books or other information on them.

Model number is KS20285-L1

These were manufactured for the Bell System Mobile radio service.

The price for a complete repeater (TX and RX Cabinet) $200.00.
The catch, you have to come and get them.

To be fair, the first one with the price and transportation takes them.

Contact me by E-Mail at gerryc@airmail.net. If contacted by E-Mail, I will be happy to provide my phone number for further discussion.

If you would like visit the GARC web page,the URL is
http://web2.airmail.net/gerryc/garc.html

Then maybe you should have posted the whole scenario, so you would have
sounded like a crack-pot?
If you had asked "is there a way to tell if someone is using a device to
jam a transmission" you may have received more REAL help.

Yes, there are ways. What type of transmitter are you using?

[snip]

Let me guess... your theatre group is using sound reinforcement,
possibly with
wireless mikes. The reason that it only shows up during preformances
may well be
that is the only time you are using the sound system's mikes?

Are your Speaker cables shielded? Are your Mike cables shielded? Are
you using
LOW Impedance mikes? etc.

> > I didn't expect people to jump to the conclusion that I was out to cause

There were two at least two separate programs on QRZ's CD-ROM (in their large and excellent collection of shareware) that will run in a rudimentary PC-XT or better, under DOS, that communicate with the TS-450 through the Kenwood IF-232C. I used both of them successfully with a cable of about 100 feet. One of them was LOGEQF, as I remember it The other one escapes me, but I can retrieve it. I haven't used them for over a year. If you do not have access to these programs (maybe the QRZ web site allows you to download it) you can send me a SASE with a 1.44 MB diskette, and I will pull them off the QRZ CD-ROM and put them on your disk and return it to you.

By the way, those programs are really excellent. I couldn't believe how well they work. My only problem with either one of them is that you don't get any control over volume, rf gain, power level, etc., i.e., all controls with analog controls. But even the S meter readings come through - isn't that neat?

Bob.

I was wondering what the best value in a 2m mobile and HT is...I will be going for my tech class license in a few weeks. I have been thinking about the Kenwood 261 or the Alinco 140tq for a mobile, also the icom 2000. I think the Yaesu ft10 may be good for a HT. Any other HT that you could recommend, and which of the Mobiles is the best for the money.

All the modern solid state rigs have fold back protection. The protection in the IC-706MKII works just fine as I found out when I mistuned my screwdriver antenna. On the face there a meter which is an "S" meter on receive and as a SWR, power meter or ALC meter on transmit.

6558. Picture tube problem?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-28 00:00:00 UTC
From: torpor@skognet.com
Message-ID: <60klt3$n06$3@flood.xnet.com>
Source record: 165124

I am trying to determine if the picture tube in my VGA monitor
has a problem.
My VGA monitor changes color while physically moving the
monitor from upright to either side, front or back. I suspect
the electron gun support mounts inside the picture tube are broken.
The outside convergence magnets are secure in their mountings
and I cannot find any other loose component(s) which would cause
this strange behavior.
Has anyone else seen this kind of behavior/failure?
Please reply to torpor@skognet.com
Thanks.

From: Tony Hance <kryten@humanoid.net>
Message-ID: <01bccc08$e2234c20$9d5fa5c2@tonhance>
Source record: 165128

Hello all !

My RCI 2950 has a problem. The Send and receive frequency on AM/FM has shifted about 2.5 kHz all by itself.

I now need to use the SPLIT option to be able to be on the right frequency for people to hear me loud and clear.

Now comes the strange part:

On SSB it all works fine withe frequency shift. No problems there.

I never have been tampering with this radio so the freq shift cannot be my own fault.

Any one know how to overcome this problem???

I do not login to news groups very much, so please be so kind as to send me a reply to my email adress if you will.

kryten@humanoid.net

Thanks in advance.

6564. Re: Re. What is a Fair Price for a Drake TR-7?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-28 00:00:00 UTC
From: BOB DUCKWORTH <bob@atl.org>
Message-ID: <342E1738.6E82@atl.org>
Source record: 165130

Based on recent sightings.

Nasty, non working, sticky paint $50
Clean, complete, non working, no acc. $150 to $200
Complete TR7A or 7 equiped as 'A' with PS7 $450 to $750
RV7 add $50
RV75A add $250 to $350 (Don't ask me why, I don't care for it)
Sherwood RF/IF filter kit add $350+++

As with anything. If you want it 'right this minute' it costs more.
Likewise if someone wants to sell 'right this minute' it fetches less.

I just got my TMV-7A back after having the reflective face changed.

The new face is less reflective. It has a very very slight textured or frosted look.

I cant say how well it works yet because I just got it back and have not been able to test it under all lighting conditions.

It took Kenwood about a week to do the work once they got the unit and a few days for UPS to ship it back (surface).

I sent mine in overnight mail to speed things up.

The new models come with the new face.

> Please reply to torpor@skognet.com
> Thanks.

This is a normal occurance. What is happening is the monitor's purity magnets (thoes at the back side of the yoke) adjust in unison with the earth's magnetic force. When you turn the monitor on its side it changes the magnetic field that the magnets see, hense the colors change. Try this with your TV works the same way. There is nothing loose or wrong with your equipment.

I grew up repairing TV's with my Dad in the '60s and '70s, it was a mind bender when going into someones home and turning the TV on its side and watching the colors change and listening to the comments.

I have a brand new RS TRC-226, with all the extra amenities, such as hi-low power switch, LCD readout, 40 ch., low battery indic., center-loaded antenna, ceramic filter, $35 plus $6 for shipping and insurance.

Thanks,

Ed

WM7D is to be commended for a thoroughly excellent page on the FT-920. I sense that he is really objective in his comments and appraisal of his 920. (Unfortunately many of us (myself included) tend to be very loyal to our purchases and ignore problems or downplay them. Often in this NG comments slamming another's rig and telling them to buy what they just bought comes across as some kind of owner justification or validation of their own expensive purchase)

Yaesu has shipped the 7Hxxx serial numbers. No comments have been received about these having the earlier problems. Has the IMD been cleaned up? Anyone?

Too bad there's no similar page devoted to the TS-570D/S. Maybe I missed it but I do not recall a similar review by QST on the TS-570D. I did catch a CQ review but it had no lab tests or specs.

I've used a MLA2500 for several years now and like it fine. It still has
the original tubes and they are still full output. One just needs
remember to keep the grid current in mind when using tubes with limited
grid ruggedness.

Paul -

Check WM7D's latest lead-in comments. He states that he's had "NO major problems" with the radio except the antenna tuner failure last weekend. He attributes most of the earlier issues to "operator error." It's an easy radio to use incorrectly at first. There are a lot of bells and whistles. The one item that remains a problem, in my opinion, is the manual. I have the 2nd version and it still has several errors. Reading the WM7D page and a little experimentation put everything right for me within the first week. The little beastie has given me no cause for concern beyond my own operator errors.

I have a GM300 UHF TX with an M120 UHF RX setup at a very noisy site (numerous paging, cellular, broadcast and uhf/vhf repeaters). Using only a basic duplexer, it is working fine. I set the output power back to about 2/3 the listed output. I did put a fan on the back and am using Comm Spec 3200 controller. So far so good. Used M120's are about $225-$275 for a 40 watter, if you can find them. Let me know if you need anymore help.

Source record: 165145

The effects you have observed are normal when you move a monitor or color TV as you describe. The tube is very sensitive to magnetic fields and just rotating the CRT throught the earth's magnetic field is enough to cause a wide variety of color shading. The blotxhes of errant color are what are referred to as a "purity" imbalance.

The CRT is surrounded by a coil of wire (de-gausing coil) the de-magentizes the CRT each time you turn the power on when the monitor is cold. A thermistor heats up and turns off the de-gausing coil after a few seconds. Some high end monitors have a manual de-gausing button you can push whenever you like. Monitors that are moved about on carts often have large noticeable blotches of color because they are moved so much. TV technicians have a hand held de-gausing coil that generates a very strong field and can correct those problems.

Do not attempt any internal adjustments to correct color purity. If the internal de-gausing coil is defective or no longer sufficient to correct your problem you may need someone to manually de-gaus the monitor.

Why overstate this so-called technical point. It is important to know the policies of the VEs administering the test. But very few would truly consider these "different codes". I'm already impressed with your expertise. No need for overkill.

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

I recently purchased a Kenwood TS-440SAT HF radio. I installed the communication chips per the owners manual. What I need is some information on how to connect the radio to the RS-232 port on my computer. I know that you can purchase the interface box from Kenwood, but I would like to build the RS-232 interface circuit myself. Any help with this project will be greatly appreciated.

Also, are there any shareware communications programs that have been written for the Kenwood TS-440SAT radio.

Thanks in advance

If you still have the shipping box for your TM-V7A look at the end
panel where the white model/serial number sticker is located. If this
sticker has a large "ONE" stamped on it, the modification has already
been done. This is per the Kenwood technician I spoke with. This
modification does not help much. I will be relocating the TM-V7A's to
a different location.

6589. Icom IC-32AT question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-28 00:00:00 UTC
From: Joe <mitstoll@flinet.com>
Message-ID: <342DECF6.6AAD393B@flinet.com>
Source record: 165155

Does anyone know how high the serial numbers went in production on the Icom IC-32AT dual bander handheld? I have seen the lower numbered ones with 01200s and newer ones with 07100s, but none higher. Surely they made more of the ATs than that.
The radio was also available as a 32E in other countries.

Cheers!

Joe

People should read the wm7d page. He bought one of the very first production units and was a willing guinea pig. I've had an FT-920 for about 2 1/2 weeks (S/N 7H040141) which is from the sixth production batch and has none of the problems reported on the early runs. The alpha character represents the prouction run - they started at "C." It looks like "H" and above are fine. Almost all new models have manufacturing and/or design defects. After about six months things have usually been addressed.

Nope....havent been for sometime....the trustee &/or control op
is ONLY responsible for the tfc ORGINIATING at the rptr...
not being repeated!!! Read 97.205g .

> I'd guess that the locals know this person -- and have
> for many years -- and know that it's safer and easier
> to ignore him than to try to make him stop.
>
> Ignore it. Pick a different repeater to use.

I know the problem on 145.47 in Houston....WHY they dont DF
the guy while on a different band like 220 for coordination
is beyond me...but then there are a LOT of things that happen
in Houston amateur circles that has always been like that!

> It could be worse -- you could live in the Dallas/Ft. Worth area
> and have to deal with a hundred people like that on every
> repeater. Difference is, they ARE the repeater trustees.

Hmm, well, Im not a trustee but our rptr in Dallas is nice and
quiet except for the occasional "jammer" (we know who HE is....and
will eventually get him) but then we have such a small group, we
don't get bothered much.....(and we don't require guys to
wear a dress like one rptr channel does :)

Verify that the account exists and the bank balance by calling the bank
listed on the check and go ahead and deposit it if the balance is
sufficient. Deposit it at your bank, and if they give you lip about the
post date, explain the situation. Besides, checks are drafts that are
payable on demand.

I have to admit that I only considered the HF/6M side of the radio in answering this question. Two meter antennas seem like such no brainers that I never thought of that side. I will have a look at the MK-II and see if it has any protection.

6598. Hammerlund Roberts HiQ receiver questions?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-29 00:00:00 UTC
From: Jim McKinnon <radiola@ihatespam.com>
Message-ID: <60oatf$sv8@winter.news.erols.com>
Source record: 164965
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.shortwave

I just picked up a Hammerland Roberts receiver. It uses 5 - 01a's. It looks like a kit but has a nice engraved panel. It is also in a cabinet with a gold decal that reads that the cabinet was built to Hammerland Roberts specs. I have an AC Super wasp in the same cabinet. Does this set use plug in coils? The only coils in it are the ones on the tuning caps. Is the set a boat anchor or does it have a little value as the Superwasps and SW3's do? Sorry about my questions, but I collect mostly early 20's broadcast receivers.

Thanks,

Cash it. The banks don't recognize any of that predated junk. If it
bounces, you can take him to court for writing a bad check. That stuff he
wrote about paid in full is nonsense, too. The seller determines when
something is paid, not the buyer, and the courts recognize that.

This guy is a real slime ball. I hope you can nail him.

Welcome to the world of buying/selling over the internet.

Sounds like you learned a hard lesson. ALWAYS ship via UPS (or any
other favorite shipper that uses a tracking system), ALWAYS use COD
(money orders ONLY - checks tend to bounce), ALWAYS retain paperwork and
records until the transaction is completed.

In your case, the next call should be to the police department that
serves the Sandusky area.

Good luck!

AFAIK, the FCC no longer issues Class D FM Broadcast licenses (10 watt
educational FM stations). It's all Class A and above now.

It's not a simple process where you fill out an application, send in a
fee, and buy the equipment off the shelf. It's a complex process that
can take several years to accomplish. You have to apply for the
license, have a comprehensive engineering study done to ensure your
station will not cause interference with ANYBODY, get a construction
permit (when you get the initial OK from the FCC), buy the equipment --
transmitter, antenna, feedline, studio-transmitter link, transmitter
site, Optimod, studio equipment, EBS system, transmitter remote control,
have another engineering study to make sure it all falls within FCC
guidelines, and get the final nod for the operating license. Don't
forget that you also need a Chief Engineer (in your case, a part-time
employee is OK) under some sort of contract and retainer fee to keep
everything running smoothly. We're talking big bucks ($50,000 to
$100,000 neighborhood for a basic set-up) to get up and running.

I couldn't tell you where to start looking for grants. Lots of
research.

> PS Also, what is needed to pass the FCC tech test(age requirements, degrees)?

You just need to pass the FCC Radiotelephone Operator's License test
(what the Chief Engineer must possess). There are no age or educational
requirements.

On air operators (DJ's who run the controls) must have a Restricted
Radiotelephone Operator's Permit (fill out the application and send in
$35) which basically says that you are trained and know how to operate
the transmitter and EBS equipment.

One local high school here could no longer afford to maintain their
station and they shut themselves down. It's expensive to maintain.

Don't even attempt to homebrew an FM station. Fines for running an unauthorized broadcast station are pretty stiff ($20,000 and up).

Hope this helps. I'm not trying to scare you away from building a station. It's a great thing to have. I'm just letting you know what's involved.

6611. TS-850 Transverters?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-29 00:00:00 UTC
From: Dan K Nelson <postmaster@fbi.gov>
Message-ID: <60ni6tdcl1@gte1.gte.net>
Source record: 165044

I noticed while re-reading my user manual for my TS-850/sAT that it has a section on connecting "the transverter(s)". It does not give any specific details, but it does tell how to connect the unit and use the set-up function to change the display to tune from 50-52 mhz. It also tells how to change it to tune the 2 meter and 70 centimeter bands.

I have tried these menu functions, and they do work. My question is: does anybody know anything about these transverter units? I have the user manual, service manual, and sales brochure for this radio, but nowhere does it give any further info regarding these accessories.

Since I was seriously thinking about changing rigs to get the six meter band, I am really interested to find out if it can be added to this radio...

I have a much modified TS180s and wish to fit a notch filter at the IF.
The audio one I have works well, but strong signals capture the AGC.

I have not found any designs in all the books and mags I have.

The TS180s IF is 8MHz and I will convert this down to 455 or 100kHz. and
do the notch there.

Anyone with ideas/circuits or how it is done on a commercial rig.

Many thanks

I am very interested in becoming a radio amateur and now learning to be one.
My only problem is that I do not know where I can buy a ham radio and a
modem usuable for the radio. I am specially interested in hand-held
radios (complete, but if it is a kit, it is also not a problem)
I know that a real radioamateur bilds its own radio, but I do not
have all of the vital devices to build my radio. (See : I do not want to
make QRM with my badly adjusted radio)

So, if anyone has any idea where I can order from a cheap, hand-held
radio and modem, please notify me via my internet-address.

And if anyone know what is the highest speed can be reached by the modem,
tell it to me as well.

Thank You for your help in advance,

Sorry if this upset you, John, but if we must test applicants for Morse Code speed, then we should actually use Morse Code on the test. Farnsworth and Morse *are* different codes, regardless of whether "few" would agree or not. All five timing elements of Morse Code (actually the International Code) are carefully specified by the ITU, and Farnsworth Code doesn't meet those specifications.

It *does* make a difference, particularly at 5 WPM. People who have learned 5 WPM Morse Code often fail when faced with 5 WPM Farnsworth Code on the test. They don't sound the same at all to the neophyte's ear.

I've heard all the arguments about how Farnsworth Code makes learning *faster* Morse Code easier. And those arguments may even be true. But that's no comfort to those attempting to pass a 5 WPM Morse Code test. The regulations say Morse Code, and VEs should *use* Morse Code, just as specified by the ITU. Fortunately, a number of VEs do, but not those accredited by the ARRL. This is particularly ironic given the undue emphasis the ARRL places on Morse Code testing.

>joints on the board on the back of the CRT!

Right, Sid. Bad solder joints on the CRT socket board, or bent or
corroded pins in the CRT socket, are the number one causes of this
problem. I just fixed my 17 inch Addonics monitor which had this
same problem. It was a cold solder joint on the socket board. (Could
also be a cold joint on the main board where the cable from the
socket connects to the main board, but that's less common.)

Note to Lester: if the guns inside the tube were really loose, you'd
know it. There'd be a loud bang when they shorted together, and
smoke from the video drivers. Then you could throw the monitor
away confident that it wouldn't be economical to repair. (The clearances
inside the tube are really tight, if anything was loose, it *would* short.)

6625. ANOTHER SAD STORY...Update!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-29 00:00:00 UTC
From: "Holly M. Cole" <rogerc@northnet.org>
Message-ID: <01bccce3$7386fc40$039802d1@rogerc>
Source record: 165058
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Greetings,

Well to "all" of you who have been following my story and to the many fine amateurs who sent e-mail in support I would like to pass on the "update":

Received a PERSONAL CHECK not the agreed upon BANK MONEY ORDER.

The check was in the amount of $275.00, not the agreed amount of $325.00.

And this is the best part, the check is DATED 31 OCT 1997. "Do not deposit until" written across the top.
We're talking another month on this and "will the check even be any good" when I do cash it?

He even wrote: "PP. IN FULL KB8WTR" in the MEMO portion of his check, like his saying so makes it so!

To ALL of you who have sent messages of support I want to say thanks! I knew there were a lot of "good" amateurs out there. Since I do not consider this matter closed, and I've sent him an e-mail telling him so, I hope that those of you who have chosen to "support" me in my efforts,will continue to do so!

Respectfully, Roger

The most reliable "Jamming Device" was the one I saw on display during a visit to the WPAFB, Dayton Ohio, last year. It was used in the Gulf War during the Desert Storm Operation and it looked quite like a "Smart Bomb". I recommend Adrian to contact the US Airforce for their rental charges.

Since the "Jamming Device" is supposed to be operated from mid-air, I suggest Adrian also to check into a long-range flying vehical. I think the B-1B should be sufficient to stay in the air long enough for his jamming pleasure. Also contact the USAF for their rental details.

Some time ago somone wanted to know if the Kenwood TMV-7a could change frequencys while being controlled from a remote radio using touch tones.

The answer is Yes it can change freq. while being controlled from a remote.

There is a jpg document you can down load from the Kenwood ftp site that outlines this feature. It is in the applications notes directory.

6634. Re: TM-V7A Face fix??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-29 00:00:00 UTC
From: tnic@IDT.NET
Message-ID: <60omkr$rpo@nnrp3.farm.idt.net>
Source record: 165067

Your milage may vary...
But the change improved the display in my case. In fact I sent back the head to my second TMV-7A for the face lift.

I also sent back the mike and had the "hot open" mod to prevent touch tones from making things happen. I also got the "tinny mike" mod done.

BTW the remote operation now workes very well. You can download a JPG doument from the kenwood ftp site that explains the remote operation.

It allows you to change frequencys and lots more with a hand held remote. It works pretty well but you need the document to remember what to do (at least I do).

The remote operation in the manual is not documented very well. Get the jpg.

6635. Tube substitution in Swan finals

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-29 00:00:00 UTC
From: kmccoy@stetson.edu
Message-ID: <60mur3$l68$1@beret.stetson.edu>
Source record: 165068
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Pardon the cross-posting. I am having some trouble while transmitting on my vintage Swan 400 (all tube). It seems to arc once the tubes in transmit circuit heat up; the lack of visual evidence around sockets and solid state components leads me to believe it is in a tube somewhere. I have tested and replaced all tubes except the finals, since the setting instructions are confusing to me, calling for an external ampmeter to further adjust the bias to 55 ma (even though the adjustment knob only goes to 50 ma)...

Anyway, the real reason for my post is that the tubes currently in the final amplifier stage are 6146. The schematics and manual call for 6HF5. The compatibility of these separate types is unknown to me; the settings on my Heathkit TT1 tube tester differ greatly.

Does anyone know whether these tube types are compatible, or should I consider trying to acquire the original tube type called for in the manual? I don't *think* there has been any modification to the circuitry.

Please reply here or email me directly at kmccoy@stetson.edu

Thanks much,

Ken KF4BQF

I don't remember the URL, but I use a shareware program called Kentrol with my Kenwood R-5000 receiver and it set itself up automatically and ran perfectly from day one!

As in any software, you have to judge whether the user interface and feature set implementation is to your liking, but I think Kentrol is worth checking out. I got mine from their web page some time ago. One of these days I intend to register it (I haven't had a chance to use it recently).

I have a Yaesu FT8000 I would like to sell. It is about 5 months old and in absolutely NEW condition. It is a 2m/70cm mobile. It has extended receive on both bands plus 800Mhz receive. Backlit microphone and all the usual bells and whistles. I have the box and all paperwork with it. No scratches or dents and was used very little. Non Smoker.
$450 and I will ship it.
I would also trade it (and a couple of bucks) for a mobile HF rig. Icom 706, TS50, or Alinco DX70.
Email me for any further details

Source record: 165073

Has anyone had any experience with the Icom IC-2710 transmit audio. One of the locals has the radio and the Tx audio sounds 'mushy'. I don't know if it's PLL noise, it sounds like the radio has separate mic gain and deviation controls, i.e., high mic gain so the deviation is always limiting. There's no schematic supplied so I don't know where to look. Any comments / suggestions would be welcome!

Jim

I can't speak directly about the Mk II, but the original IC-706 does
not have foldback protection on 2m. The SWR bridge is only in
the HF side of the radio. It actually uses the driver stage as the PA
for 2m. It appears that the driver transistors are rugged enough to
tolerate mismatches (same as most HTs, which also don't have
foldback protection). On HF, the radio starts to fold back when
SWR exceeds 2:1.

Shows to be Part # S01-2408-08. This shows to be a sub for S01-2408-15
which has been discontinued. Good luck.

Source record: 165083

I used to have a Seiko SVGA monitor that acted just like that. I didn't open the monitor and examine it because I know I am not good at HV tube devices. Fortunately, I found out that it really wasn't any problem inside; instead, it was the video cable that acted weired.

The RGB color signals are fed via 3 seperate wires and mine had the Red wire broke near the back of the monitor. It might have caused by not having enough clearance between the back of the monitor and the wall. Anyhow, when the monitor moved, the display became bluesh or greenish.

Seiko wanted to charge me $100 for replacing the cable plus labor and shipping both ways. I told them to go to hell! I took it apart (not a very good experience) and re-solder the RED BNC plug. The problem was fixed.

Best 73!

In regards to Mail Fraud....I sent off to another Ham a Postal Money Order for a hard drive for my computer. There were many excuses as to why the hard drive was never shipped. Never recv'd the hard drive and in the end the ham just hung up on me when I called. Anyhow, I contacted the postal service and they listened to my story. They then asked..."Why do I think that has anything to do with Mail Fraud???" I answered that since i sent a postal MO and sent it thru the mail, that I thought that was Mail Fraud. They finally agreed that maybe it was..that I had to pay for a copy and trace on the MO, and then fill out the paperwork. But not to expect anything as they are too busy to worry about one persons problem. So much for help from them!!
The Ham is KC8EYT and his name is Terry Richie located in Fremont OH....BEWARE of this guy also!!!

I just obtained a Hy-Gain DX88 10-80m vertical antenna at a local swap meet and am getting conflicting information about this antenna. I have been told that radials are not needed if it is mounted higher than 25 feet. I have also been told that radials are required. I plan on mounting this antenna on a chimney mount at about 35 feet. Perhaps someone who is familiar with this antenna can clear this up for me. Please e-mail me at jsollows@bigfoot.com. Thanks for your help.

My local store had their probscope clearance priced at 59.95 so I had to have one! The problem is this 1. The Windows software wont do anything under windows 3.11. 2. the dos software wont read the keyboard under dos 6.22. 3. the dos software runs perfect under windows 3.11. Any ideas? Has anyone written software thats better than Tandys? I realize this probably isnt the best place to ask this question but I couldnt find the "Probscope" news groupe...hi...

6658. CMA510 adapter for Standard C510A, Anybody got one? Comments?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-29 00:00:00 UTC
From: miker <&mreiney@hevanet.com>
Message-ID: <343013E4.58D8@hevanet.com>
Source record: 165091
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I'm interested in the CMA510 adapter that plugs into the Standard C510A.
This is not the power booster, just the mobile adapter.
I can't find anyone or dealer locally who has one.
Sounds like it's a plug that sticks into the bottom of the radio and
breaks out into an antenna connector and a power connector. True?
How sturdy is the connector? Other comments?

I'd like to use the radio in several vehicles, so the $100 each is more
than I can stand. Is ther a part number for the plug and attached
cable alone? Anyone found a source for a compatible cellphone plug?

In a pinch, I could get by connecting only the antenna thru the bottom.
I don't expect the top SMA connector will last very long if I'm
constantly
removing the antenna. Plus it's a real pain. Is there a generic type
connector that fits the
coax connector in the bottom? It's not at all clear what actuates the
switch
in the bottom antenna connector.

It's great radio that could meet all my 2m/440 needs if I could hook
it up mobile cheaply.

TIA, miker

6668. Super CMOS Keyer 3 Problem Fixed!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-29 00:00:00 UTC
From: ka0rny@midusa.net
Message-ID: <343033b3.115811327@news.midusa.net>
Source record: 165101

Hi All.

A couple of weeks ago I posted asking for information on how one might be able to fix the Super CMOS Keyer 3. Things finally let up enough at work that I took the unit in today and did some snooping with a scope. One of my concerns was whether the Micro-controller was getting a clock pulse from the ceramic resonator. It certainly was and was oscillating at 2 MHz. I also looked at all the other inputs and all seemed to be as normal except that pin 6 of the CPU which provides +5 V to the EEPROM never raised above 0 V at anytime, either during power up or for any length of time after.

The breakthrough came after I got back home and suddenly it dawned me to check pin 6 of the CPU with the EEPROM removed. Viola! On power-up I noticed a brief pulse of +5 V and a little noise from the sidetone speaker. I dug through the junkbox and found a 24C16 EEPROM which was a pull from my KAM due to an earlier upgrade. What did I have to lose I thought?

Well, the fates were with me and the keyer came to life although a few of the settings are weird due to the EEPROM having been previously used, but a reset and a little reprogramming and things seem to be as good as new. I'm glad this fixed it as I really didn't relish the idea of springing for another $55 for a complete parts kit. Great keyer, just seems like the support and contact information could be better...

Avcom Portable Spectrum Analyzer PSA-35A
RF input 10-1750 Mhz
RF input 3.7-4.2 Ghz
LNA/BDC PWR +18VDC on RF Inputs
Referance Level 0-(-40)dBm
5-slide band select 0-500,270-770,950-1450,1250-1750,3700-4200
6-Preset frequency band
span 0-50 MHz/DIV
scale dB/DIV 2db and 10 dB
Line and Bat operat

Frequency Coverage 10-1750 MHz 3.7-4.2 GHz
Basic enough to begin with - sophisticated enough to grow with .
Ku and C band compatible
Built-in DC Block and Power for LNA's and LNB's
Accurately measures wideband signals commonly used in the satellite
communications industry
Lightweight (17lbs.) and Portable - Ideal for Test Situations
Rugged, Attractive Styling
Made in the U.S.A.
New Priced
at /$1,965.00/in http://www.fotronic.com/avcom/psa-35aspecanal.htm.

Troubleshoot system problems by observing output signals from LNA's,
BDC's, Line Amplifiers and Splitters, and other RF signals components.
Measure block system signals balance.
Identify and resolve terrestrial interference problems quickly
and precisely by displaying offending signals on the PSA-35A.
Customers can be shown the nature of TI problems for clearer
understanding.
Measure and document satellite communication system performance after
installation or service. Customer should be given a copy of results per
AVCOM'S SASAR (Spectrum Analyzer System Analysis Report) to insure
customer confidence and satisfaction.

Progressive Satellite Communication Dealers, Repair Centers,
and Manufacturers will find AVCOM'S PSA-35A Spectrum Analyzer
to be an indispensible instrument for rapid testing and alignment
of satellite equipment. Problems that might otherwise take hours,
even days to resolve, can be identified and corrected in minutes,
saving time and money, while reinforcing customer good will.

An AVCOM Spectrum Analyzer will pay for itself quickly.

Eric...

It IS OK to get your radio before the ticket (perfectly legal, but you can't transmit until you get your licence!) Listening to the "action" on the bands sometimes can help keep up the enthusiasm as you study for that first "ticket". Good luck to you and I'm sure there are many hams on this group that would be happy to answer any questions you might have. Go for it!!!

>If i am missing something obvious, please e-mail

It's a standard Motorola 2135 key. Most 2-way shops will have one or more
they would be happy to give you. As a last resort, I am sure you can buy
one from Motorola or get someone here on the net to make a copy for you.

I know it is hard to believe when you don't have one, but they are really
quite common. I think I've had the same one on my keyring since 1962. :)

I cannot find the hardware mod there. Only instructions how to control the
TM-V7 with DTMF from a remote station.

Is there any other side where I can find the hardware mod ?

6681. VX1R had CPU replaced

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfEHBz93.G3t@netcom.com>
Source record: 164910

My VX1R (very early, rev A00) has had several software bugs, (not just objectionable features, of which it also has several, but actual differences with the user manual procedures, of which it had several.) I had decided to "live with" it. About 2 weeks ago, after an overnight recharge, the radio really went nuts, with bizarre display combinations and weird volume control range and other problems. I tried both reset options, and at that point it lost control completely, and could not be powered up at all. I sent it back to Yaesu complaining of EACH of the bugs, and the hard failure it experienced. It just got back, and the person at Yaesu said it had "cpu replaced". I don't remember how to check the firmware version, and haven't had a chance to verify any of the "bugs", but I thought it would be of interest to the users of this radio to see how Yaesu is handling it.

Anyone have any pet bugs they'd like checked out (ONLY things where it doesn't work as per the documentation, and is reproducible)? Anyone care to tell me how to check the firmware rev?

Hello. I am looking at getting the Yaesu VX-1R. When I learned that there is an extended TX mod available, also knowing that it could RX the 220 band, I got excited. With the extended TX mod, can you use the radio as a "Tri-Bander", 2m, 220, and 440? Also - what is the range of the extended TX mod? And - is there an extended RX mod (as if it's not already extended enough! - I was looking to get the 6m band.) Thanks 73, MIke VE3XLS miszak@itcanada.com

I had one of these many years ago. Its best use is as a paper weight,
but you can change it to cover the 145 MHz range. This radio uses
a primitive synthesizer design called a "crystalplexer". It beats a number
of switch selected crystals against each other to obtain the required
frequencies. What you have to do is change the "MHz" crystal so that
it tunes 1 MHz lower than stock. I don't remember the value of the
crystal now, too many years ago, but a look at the schematic should
tell you which one it is.

relax a bit Mike, the vx1r is practically deaf in the 220 Mhz part of
the band as was the FT50 and produces microwatts of RF output there.
Don't get too excited about wideband products. If it could concievably
be a tribander or better the manufacturer would be the first to exploit
this information and max out on sales.

Nope... old information. Got an RS mailer today that says "Last Call"
on the HTX-404 at $149.95!

This radio (and its 2 meter brother, the HTX-202) seem to be immune
from interference. It is really nice to see narrowband radio
performance as compared to all the glorified "scanners with a
transmitter attached" that everyone is selling nowdays!

6701. MD100 MIC and older Yaesu rigs???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: STEVEN L UMBACH <N9ROU@prodigy.net>
Message-ID: <01bcce03$7a4fb8c0$5485edcc@default>
Source record: 164930

I have tried to use the MD100 mic that came with my FT1000MP on my Yaesu FT726R with no avail. As far as I can tell the mic pinouts are the same. The FT726R hand mic will work on the FT1000MP though - not that I want to use it though! When I connect the MD100 to the FT726R I get no ptt. If I activate the manual transmit on the FT726R and talk into the mic then it works. I know that AES says you need a special $22 cable to get this mic to work on older Yaesu rigs, but I would rather make my own for about a third of that. Anyone know the trick to get this mic working on older rigs?? Thanks for any help.

---- Steve N9ROU

6702. E-Z Clone Software for TM-V7A

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC

6703. Re: Mitrek Info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: byoumans@neo.lrun.com
Message-ID: <3431831e.1360531@news-server>
Source record: 164932

Motorola offered the Mitrek in three different frequency ranges
together which covered about 138 to 175 Mhz. The schematic and parts
list (if you have one) shows the different values for the capacitors
that are different for the three ranges. Other than the values of a
handful of components the three radios are identical. If you are
lucky the radio you have will tune up on 2M without modification. At
worse you might have to change perhaps $20 of parts. The downside of
the using rados like this is the cost of the channel elements. Be
prepared to spend about $70 for each frequency you want to use. They
make great packet radios and repeaters!

BTW Motorola sells Mitrek manuals today for $25 plus S&H. They are
weel worth the expense if you have a god radio and want to do much
with it.

This matches my experiences with my FT-50 in my vehicle.

For working via repeaters, the Mirage dual band 2m/70cm 50W/35W brick
is an ideal companion to an FT-50. The amplifier gives you the boost
to fully drive the repeater, which then picks up and re-transmits your
signal with excellent power and coverage. If you can get into a
repeater you can (usually) hear its output very well without
additional receive amplification. But the Mirage dual band amp is not
good for simplex work, as it lacks pre-amps on both bands. For
simplex work with the FT-50, either the Mirage or Radio Shack
mono-band 2m 35W amplifiers work really well, as they have a
swtichable pre-amp so you can hear the other guy now that he can hear
your amplified signal.

> One other observation. Using the FT-50 with a Cushcraft AR-270 (I'm
> sorry, the specs on it slip my mind at the moment), in my attic,

I agree. But this one little radio does it all. Did we mention the superb scanner features?

For automotive use I have the Yaesu one-ear head set, boom mike, and VOX. I put the speaker over my right ear so I can still clearly hear external sounds. I put the microphone close enough to my lips that I can stick my tongue way out and lick it (not very tasty, but you get the idea). If I set the VOX gain all the way down, I can drive with the driver's window open without triggering the VOX. If I turn the VOX up with the window open, the wind noise triggers the VOX. If I close the driver's window the VOX works correctly at any setting.

> > Has anyone tried using their FT-50 as a mobile by adapting the SMA to BNC
> > with coaxial cable to an external antenna?

Yes, I have used my FT-50 as a mobile for more than a year now. I have an SMC to BNC and a BNC to female UHF adapter stack. I drive a Comet 5/8 atop a magnetic mount atop my Jeep's roof. I routinely work repeaters from 50 miles away. Last Saturday I set my personal VHF simplex record talking to a chap atop Pike's Peak in Colorado Springs, a distance of approximately 125 miles. I was running 5 Watts out of my FT-50 into my 5/8. He heard me loud and clear.

I also routinely use my FT-50 via a long coax run to a Diamond V2000A mounted atop my roof. I can comfortably talk all around my home town on 100mW.

> > How about the cigarette lighter adapter for external power?

The cigarette lighter adapter allows you to run full power (5W) without even having a battery attached. I bought the AA battery back and leave it empty so I can attach it to close up the exposed back of the radio when mobile and using the cigarette lighter adapter.

> > Will this setup extend the range significantly?

Versus your rubber duck? At least 12dB additional gain over the stock Yaesu FT-50's rubber duck operated from within the vehicle.

> > What would be a good choice of
> > antenna for my car (with the best band coverage)?
> >
> > Arthur G.

Any mag mount and vertical antenna atop your vehicle will greatly help you work distant simplex and repeaters with your FT-50. With my FT-50's stock rubber duck I can work repeaters about 10 miles away with some difficulty at 5W and run simplex 5 miles with great

difficulty with 5W. With a 5/8 and a mag mount atop my vehicle's roof I can (and have) worked simplex over 125 miles and have routinely talked via repeaters 50 miles away. My theory is to buy the biggest, baddest magnetic mount you can find, and the biggest Diamond or Comet dual band antenna you date mount atop the mag mount. If you are willing to drill a hole in your vehicle's roof for more structural rigidity you can mount an even higher gain dual band antenna and get even more range out of your FT-50's 5W output.

Visit a ham radio swapfest in your area and shop for used Radio Shack HTX-202 2 meter hand held. These radios are bomb-proof and straight forward to operate. Nearly every ham out there has either used or owned one. You can get lots of help with learning how to drive one of those.

6146 tubes require an entirely different socket than the 6HF5. If your
radio has 6146's, the sockets HAVE been changed and other changes would
have to have been made, possibly unsuccessfully since it is not working.
Sorry, this problem may be a tough one to solve.

Yes try AG6K's (Rifhard Measures) website(don't have url in front of
me) I think he published something on this, also one of the ham
magazines had an article covering the conversion (addition) of 160, same
for SB220 or 221 some years back. It certainly can be done.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down,

then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

WEBER ELECTRONICS
PO BOX 212
5138 LAUREL LN
BROAD RUN, VA 20137
telephone (540) 347-7760

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

The TAC-1 is made in Maryland by S&S Engineering. I don't
believe they have a WEB site. If you need the info, I can try
to find my literature. The TAC-1 and other QRP rigs were
reviewed in QST in June of (I believe) 96.

Source record: 164952

I have seen the 221 modified for 160M but it's not easy or very pretty. The problem is that there is neither enough inductance in the coil or capacitance in the tuning caps for 160M Some have been modified with doorknob caps to extend the useable capacitor tuning range. The real bear is having to more than double the inductor value. The input circuitry is much easier to modify.

>Contact the Kenwood service center.

How can I see the difference between the new and the old face. My TM-V7e is 6 months old. I'm not using it as a mobile station, so the incidence of light is always the same. The display does reflect TL light but it's not disturbing (but daylight+sun may change that).

Yes indeed....they plug right into the 866 socket and the plate cap
attaches to the top just the same. Instead of a glass bulb they have a
inslating cylinder. I've got a pair in my junkbox (keepers). These
diode stacks are pruobably still available at Fair Radio in Lima OH.

Message-ID: <60plnn$k2u$2@news.wco.com>
Source record: 164973

Didn't anyone ever respond with an answer to this question? One way to jam a band of frequencies (on a local level) is to hook up a dipole cut to the band in question accross the contacts of an old Ford ignition coil (the old type that acted like a buzzer). This should put a lot of noise into the surrounding spectrum on a local basis. Be advised, though, if you do this and interfere with a govt. agency or private individual (like myself) who wants to locate this interference source, you can get in a hell of a lot of trouble.

Any other HT that you could >recommend, and which of the Mobiles is the best for the money.

I was in your position a few months ago and spent what seemed like an *inordinate* amount of time agonizing over what to do with my somewhat limited radio funds, given that I wanted to maximize the features I got for my money.

I finally settled on the Kenwood TM-261A and have been quite happy with it so far. It's got all the features you're likely to need in a 2m mobile - plus extended recieve between 118 and 174 MHz. Plus it's an extremely good buy at around $250 (FYI - I bought mine at Denver Amateur Radio in Pennsylvania; they had the lowest prices I could find by several dollars and the price included shipping whereas others didn't. Good service, prompt delivery, etc.)

I also considered the Icom IC-2000 and the Yaesu FT-2500, and probably could have been happy with any one of them. I decided against the IC-2000 because I know someone who has one and he has found it difficult to program and the radio has a habit of losing its memory, even after being sent in for service. Also heard the IC-2000 sometimes suffers intermod, although Icom is supposed to be known for superior intermod rejection.

The Yaesu would probably have made a great rig but didn't have any real distinguishing features over the TM-261A and was running around $40 more. The only real thing the FT-2500 has that the TM-261 doesn't is the ability to store a power setting with each memory - the power setting on the TM-261 applies to everything. The FT-2500 didn't have the extended receive range that the TM-261 had either.

Considered the Alinco briefly but decided to stay away from a "lesser known" name - nobody I know has any alinco product so I couldn't make a real judgement as to the quality of the product.

Can't really recommend anything for an HT; decided a mobile was better for me. But you might consider, if your funds allow, the Yaesu FT-50R, using it for both a HT and a mobile (with a small (20W or so) amplifier added) - I know a guy who does this and is quite pleased with the versatility as well as the performance of the radio. Plus

it's got all sorts of whiz-bang features you'll spend hours figuring out how to use!

Hope this is helpful. Good luck on your test; it's not really that hard if you study a little for it!

My rule of thumb for used equipment is 30% off the lowest current street price for equivalent new gear. Perhaps, 25% for something this recent.

>Also, are there any shareware communications programs that have been
>written for the Kenwood TS-440SAT radio.

I have the Kenwood IF-232C hardware box and the User's Manual thereto. It is 4 pp long and includes the complete schematic (better than most schematics) and the detailed pinouts to the 25 pin connector to the PC Serial Port and the 6 pin DIN connector that plugs into the side of a TS-450. Now, I know nothing about a TS-440, but I'd be willing to bet that this information will give you what you want.

If you send me a SASE with $0.55 postage on it, I will make a photocopy of the manual and send it. Be advised that the commercial device uses opto-isolators, and is therefor a very safe device vis-a-vis isolation. Also, be advised that if you replicate ALL of the circuitry, you will probably wish that you had just gone ahead and bought the commericial product. On the other hand, if you're good with logic circuitry, I think you could simplify this thing tremendously, because all it does is convert TTL levels in the rig to the -12 to +12 levels of an RS-232 port.

The software that I have used and that worked very well is the Kentrol program and the LogEQF program, both of which are available for download from the QRZ Web Site -- www.qrz.com/fileslhdn/archive/hamlog

: 18wpm be classed as 5wpm? Who picked such an arbitrary speed?

Because it is a better way to learn the code than the old method. You learn the sound of the character - not the individual dits/dahs of the character.

The speed is 5 wpm, as there is a long space between the characters. Note that the term characters per minute does not specify how fast each individual character is sent.

Learn the code the old way, and you will get stuck at several plateaus, the best known is at about 9-10 wpm. Learn with the Farnsworth method, and you shouldn't have any plateaus.

6748. Looking for opinions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: Joe Denison N9ZLI <misto@iglou.com>
Message-ID: <Pine.GSO.3.96.970930020322.16321B-100000@iglou2>
Source record: 164987

Has anyone on this group tried building the 40m-SLR Shield Loop Rcvr featured in the latest edition of QST? If so, could you please tell me about how difficult it was to build. I have never built anything like this before, but am interested in learing. I have found that all the capacitors and resistors (if you don't just happen to have them lying around the shack) are available from Tech America (Yes I know that there are those who absolutely hate Tandy Corp, but hear me out) fo $10.62 including ground shipping ($4.00). The receiver itself looks like it might make for a good starter project, but to be honest, I don't know exactly how to turn a schematic into a working PCB design.

As I say, this looks like it would be at least an interesting idea to try on for size, but let me know your opinions. I am interested in hearing what people who have built (or are building) this receiver have to say about it. (If you happen to have the PCB diagram that might be helpful too.)

Thanks to all in advance,
Joe Denison

+-----------------------------+ The opinions above are soley those of the
| Mr. Mistopheles | writer and reflect only his beliefs and
| Joe Denison | should be in no way misconstrued as to
+-----------------------------+ be representative of any of the agencies
|Amateur Radio Operator: N9ZLI| with which the writer is attached. Thank
+-----------------------------+ you for your consideration in this matter.

: I am erecting a GAP Titan vertical antenna this week and have some
: questions regarding the "new" FCC RF safety guidelines. I am wondering
: if anyone has any idea on the distance a GAP would have to be placed
: from an uncontrolled exposure site (or person/house) to comply with the
: RF guidelines:

Most likely, you won't have to worry about it. If you have web access, there is some very useful information on the FCC page. There is a link to a document numbered FCC/OET ASD-9601 "Measurements of Environmental Electromagnetic Fields at Amateur Radio Stations".

In the "Executive Summary", there is the statement:
"For most of the stations surveyed, current RF protection guidelines for field strength and power density were not exceeded in accessible areas. The highest readings in accessible areas were generally associated with vehicle-mounted antennas. However, when "duty factors" are taken into account routine exposures from such antennas would be expected to comply with safety guidelines."

The exposure guidelines are frequency dependent, and become more strict with increasing frequency - being strictest at VHF. The ANSI/IEEE guidelines allow a whole-body SAR (Specific Absorbtion Rate) if 0.4W/kg.

The level for several vertical radiators is as follows, listed as Power, Frequency, E-Field, %IEEE(1991), H-Field, %IEEE(1991). The IEEE limits are for "uncontrolled environments", which are more restrictive than those for "controlled environments". For all measurements, as you get further away, the field strengths will decrease - except for possible reflections or equipment hot spots.

800 W 3.8 MHz 7-161 V/m ~70% <140-1350 mA/m 3-31% Vertical steel tower

The worst case was measured only 0.5 meters away from the ground mounted antenna. The lowest was at only 5 meters.

140 14.1 2-9 3-15 12-28 4-8 Multiband Trapped
(roof mount)
500 14.1 10-97 11.9-23.8 (In shack - highest values are
from hot spots near tuner and transceiver). As you can see, there may be more of a hazard from the tuner/transceiver than from the antenna.

Surprisingly, the fields increased somewhat between 2 and 4 feet, then started the normal decrease. The lowest measurements were at only 10 meters.

250 146.5 9-25 33-91 40-60 55-82 Discone in attic

Again, all measurements taken within a few meters of the antenna. These are "worst case".

: GAP Titan : installed on ground mount at 7' above ground
: power : 200 watts....600 watts..... legal limit (always thinking to
: the future <grin>)
:
: What are theroretical diatances for stand off ?? from the antenna to
: comply ?

If you are 10 meters away from the antenna (as well as it being that far from public areas, then you probably would be fine with full legal power.

I don't have the document that goes into calculating theoretical exposure levels, but it is on the FCC page as well.

6750. Circuits Galore

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: Harry Lythall <rharris@arcturus.net>
Message-ID: <3430B59F.FF9@arcturus.net>
Source record: 164989

Circuits Galore

Hi all, I'm back!!

Two weeks abstenance has meant little work on my homepages. I have replaced the counter to another that works. During the last two weeks the pages have had '0' visitors although 130 of those have sent me E-mail. Strange!!

PMS OTA
Just before the holiday, my old PC-jurassic blew itself to bits so my packet PMS, with all the radio, circuits is off the air but Ron, G0TLA, is still holding strong.

VALVE (tube) RX
The 'valve receiver' has seen a little more work done to it and the tracking across the lower MW band is much improved. With the new coil winding data the LO/RF tracking is almost perfect. Far better than expected.

OSCILLOSCOPE
Loads of comments about the basic oscilloscope information. The general opinion so-far is that it is not so basic, what do you think? Have I forgotten anything?

SYNTHESIZED RECEIVER
The ORIGINAL circuit diagram for the 'Synthesized Receiver' project was 100% accurate. The VCO and Phase Detector chips are NOT CMOS. Thanks to E-mail, I have now been spared the laborious task of taking my own synthesizer to bits to get the information for the homepage. I will now be updating the project hopefuly before Friday. Many thanks to the kind soul who took the 'time and trouble' to sort out my cryptic mess for me and provide the information.

REQUESTS
I have had requests for VHF and UHF RX preamps Not being so interested in VHF they will have to wait a couple of weeks, but it sounds like a good idea to me.

SOON
Coming soon is an AM TX for the MW band so that old vintage radios may again 'beat' to the rythm of Perry Como, or Dave Brubek.

DC RC HITS VLF
My Direct conversion RX was sucesfuly used on the VLF bands

from 15KHz upwards, I am awaiting a response from the gent concerned so that I may add the details to the homepage.

NOT AGAIN!!!
Finally if I get just one more request for circuit diagrams to locate lost model aircraft I will scream!!!! I the best method is to write your name, address, and telephone number on the wing. You could also offer an 'unspecified' reward for its return. Readers Digest are always giving away their 'valuable' pocket calendars, printed on genuine paper.

URLS
Ok then nothing else of interest to add so here is the URL, just in case you have not bookmarked the page. You will not be dissapointed.

http://user.tninet.se/~acz732k/ Main site
http://hem2.passagen.se/sm0vpo Mirror site

Have fun with radio Homebrew / QRP / Hamradio / Wireless.
Best regards from Harry, Upplands V�sby, Sweden.

PS Several E-mail massages have begun "I am not a licensed Radio Amateur, but ... ...". My page is not exclusively dedicated to HamRadio, QRP, but includes ALL aspects of homebrewing (including the booze - Hic!) and electronic construction.

6752. Re: FT-50 as a mobile?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: Eugene Pappianne <epappianne@msn.com>
Message-ID: <01bcc18b$a013d340$18992399@grumpy>
Source record: 164991

I had the opportunity to use the FT-50 as a mobile for several weeks, and my conclusion is that it does very well.

When I first started "mobiling" it, I used the 2 watt battery with the stock antenna. Needless to say, any signals that were less then full strength, faded in and out constantly. Switching to the dual band 5/8 wave already installed on my trunk improved the reception dramatically. Picket-fencing went way down, and all the repeaters that I'm used to hearing came in just fine These repeaters are located anywhere from 5 - 50 miles away. This improved the situation, but created a new problem, although I could now here everyone just fine, they still couldn't here me, or only with much static. So I added the cigeratte lighter adapter and moved up to a full 5 watts of output. This made a big difference. I was able to work local repeaters just fine, was at least able to get into some of the more distant ones. I had mixed feelings about this, one the one hand, I couldn't reliably reach the more distant repeaters, like I did with my old 50 watt mobile rig, but on the other hand, I learned that 5 - 10 watts is all I need to run for my typical "commute" QSO's.

One other observation. Using the FT-50 with a Cushcraft AR-270 (I'm sorry, the specs on it slip my mind at the moment), in my attic, allows me to reach from Wilmington DE, to north of Philadelphia, PA (> 50 mi.) with no trouble. My only complaint would be the compact and complex nature of the controls, which for hand-held use are great, but in a mobile or house setup, are a little inconvienent.

Let me know how it worked out for you.

There is an excellent Web page that concerns RF safety,
www.cs.utexas.edu/users/kharker/rfsafety . The page runs a program that
will allow you to input frequency, power levels, antenna gain, etc. It then
calculates RF levels and tells you if you are within the guidelines. 73

I agree. So long as you don't transmit there's no problem with having
the radio. You can often get a good deal on used equipment at a hamfest
- just make sure it works okay. If you want to eliminate the risk,
dealers (Amateur Electronic Supply, for example) have good used gear
which has been bench checked and is warenteed.

Good luck,
Bob (AA4PB)

> Ken KF4BQF

YIKES!! No wonder you are having problems! The 6146 is a "real"
tranmitting tube, while the 6HF5 is a color television sweep tube. The
6146 was made to go all day and night without complaining at medium
power (about 180 watts CW input for a pair). Sweep tubes, however, are
great for *INTERMITTANT* service at high power. Doing a replacement
without circuit changes is really asking for trouble. The power supply
for the Swan probably delivers voltage too high for the 6146 and that is
causing the problem.

Get the tubes that are supposed to be in there. (I don't know offhand if
the tube pinouts are the same, so be real sure that no mods were made to
the set before replacing the tubes). BTW, they won't be cheap!

>>>>>>>>>>If nothing has been modified then 6146s would be a poor
substitution to say the least. FYI, the last time I checked
about a month ago 6HF5s at Antique Electronics were CHEAPER
then new 6146s, something like $10.00 ea... The 6LQ6s used
in later Swans are the expensive ones...

6765. help: FT-301D Schems

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: kenneke@peak.org
Message-ID: <60ptfe$8s6$2@bashir.peak.org>
Source record: 165004

Hi!

I have a Yeasu Ft-301D with a non-functioning digital readout. The rig otherwise is operable. It seems to be a problem with the display mixer osc, which sits in a little box next to the main tuning cap. On a blue moon, with the humidity just right, the display will work. When it is down, makes the rig a bit hard to operate.

So, this rig entered my life with no schems. Can somebody help?

6766. Vertical Radials in attic

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-30 00:00:00 UTC
From: jsollows@bigfoot.com
Message-ID: <34311b67.407007531@news.bc.rogers.wave.ca>

I am putting a Hy-Gain DX88 vertical up on a chimney mount. I understand that radials are required but the 1/4 wave length radials for 80m would extend way into my neighbours property. I know I can run wires on the roof as an alternative but are they as effective especially since they are concentrated to one side of the antenna. Also, can they be fanned out in the attic below the antenna without seriously affecting the performance? Your comments would be appreciated.

Thats why I think everyone should ship C.O.D. I know it takes 2-weeks or so to get your money, but I llok at it like this. You check off the cash only box, the shipment doesn't get delivered without payment. Plus I know the U.P.S. man here, when a package arrives with electronic equipment I've ordered over this news group, I look over it make sure its all there, and in the shape I was told it was in before paying for it. If its not there, it goes back. So it works both ways and nobody needs to worry about getting ripped off. Its too bad there are dishonest people in this world, but we must beware, this is the internet! So be safe & ship it CASH ONLY C.O.D. If someone won't ship it that way, the hell with'em, I'll get it from someone else who will!
